

Sphinx Documentation

Release 7.3.0

the Sphinx developers

GET STARTED

| 1 | Getti | ng Started 1 |
|---|-------|---|
| | 1.1 | Setting up the documentation sources |
| | 1.2 | Defining document structure |
| | 1.3 | Adding content |
| | 1.4 | Running the build |
| | 1.5 | Documenting objects |
| | 1.6 | Basic configuration |
| | 1.7 | Autodoc |
| | 1.8 | Intersphinx |
| | 1.9 | More topics to be covered |
| 2 | Insta | lling Sphinx 7 |
| | 2.1 | Overview |
| | 2.2 | Linux |
| | | Debian/Ubuntu |
| | | RHEL, CentOS |
| | | Other distributions |
| | 2.3 | macOS |
| | | Homebrew |
| | | MacPorts |
| | | Anaconda |
| | 2.4 | Windows |
| | | Chocolatey |
| | | Other Methods |
| | 2.5 | Installation from PyPI |
| | | Using virtual environments |
| | 2.6 | Docker |
| | 2.7 | Installation from source |
| | | |
| 3 | Tutor | ial: Build your first project |
| | 3.1 | Getting started |
| | | Setting up your project and development environment |
| | | Creating the documentation layout |
| | 3.2 | First steps to document your project using Sphinx |
| | | Building your HTML documentation |
| | | Building your documentation in other formats |
| | 3.3 | More Sphinx customization |
| | | Enabling a built-in extension |
| | | Using a third-party HTML theme |
| | 3.4 | Narrative documentation in Sphinx |
| | | |

| | | | 18 |

| | MOVED: Math Domain | 68 |
| | MOVED: More domains | 68 |
| 4.2 | | 68 |
| 4.2 | Markdown | 69 |
| 1.2 | Configuration | |
| 4.3 | Cross-referencing syntax | 69 |
| | Cross-referencing anything | 70 |
| | Cross-referencing objects | 70 |
| | Cross-referencing arbitrary locations | 70 |
| | Cross-referencing documents | 71 |
| | Referencing downloadable files | 72 |
| | Cross-referencing figures by figure number | 72 |
| | Cross-referencing other items of interest | 72 |
| 4.4 | Configuration | 73 |
| | Project information | 74 |
| | General configuration | |
| | Options for internationalization | |
| | Options for Math | |
| | Options for HTML output | 88 |
| | Options for Single HTML output | 96 |
| | Options for HTML help output | 97 |
| | Options for Apple Help output | 97 |
| | Options for epub output | 99 |
| | Options for LaTeX output | 102 |
| | Options for text output | 107 |
| | Options for manual page output | 107 |
| | Options for Texinfo output | 108 |
| | Options for QtHelp output | 110 |
| | Options for the linkcheck builder | 110 |
| | Options for the XML builder | 113 |
| | Options for the C domain | 113 |
| | Options for the C++ domain | 114 |
| | Options for the Python domain | 114 |
| | Examples | 114 |

| | Options for the Javascript domain |
|-----|--|
| | Example of configuration file |
| 4.5 | Builders |
| | Serialization builder details |
| 4.6 | Domains |
| | Basic Markup |
| | Cross-referencing syntax |
| | Built-in domains |
| | The Standard Domain |
| | The C Domain |
| | The C++ Domain |
| | The JavaScript Domain |
| | The Mathematics Domain |
| | The Python Domain |
| | The reStructuredText Domain |
| 4.7 | More domains |
| 4.7 | Extensions |
| | Built-in extensions |
| | sphinx.ext.autodoc – Include documentation from docstrings |
| | sphinx.ext.autosectionlabel – Allow reference sections using its title |
| | sphinx.ext.autosummary - Generate autodoc summaries 180 sphinx.ext.coverage - Collect doc coverage stats 184 |
| | sphinx.ext.doctest – Test snippets in the documentation |
| | sphinx.ext.ductest – lest snippets in the documentation |
| | sphinx.ext.extlinks – Markup to shorten external links |
| | sphinx.ext.githubpages — Publish HTML docs in GitHub Pages |
| | sphinx.ext.graphviz – Add Graphviz graphs |
| | sphinx.ext.ifconfig – Include content based on configuration |
| | sphinx.ext.imgconverter – A reference image converter using Imagemagick |
| | sphinx.ext.inheritance_diagram – Include inheritance diagrams |
| | sphinx.ext.intersphinx – Link to other projects' documentation |
| | sphinx.ext.linkcode – Add external links to source code |
| | Math support for HTML outputs in Sphinx |
| | sphinx.ext.napoleon – Support for NumPy and Google style docstrings |
| | sphinx.ext.todo – Support for todo items |
| | sphinx.ext.viewcode – Add links to highlighted source code |
| | Third-party extensions |
| | Where to put your own extensions? |
| 4.8 | HTML Theming |
| | Builders |
| | Themes |
| | Using a theme |
| | Builtin themes |
| | Third Party Themes |
| 4.9 | Internationalization |
| | Sphinx internationalization details |
| | Translating with sphinx-intl |
| | Quick guide |
| | Translating |
| | Update your po files by new pot files |
| | Using Transifex service for team translation |
| | Using Weblate service for team translation |
| | Contributing to Sphinx reference translation |
| | Translation progress and statistics |

| | 4.10 | Sphinx Web Support | |

CHAPTER

ONE

GETTING STARTED

Sphinx is a *documentation generator* or a tool that translates a set of plain text source files into various output formats, automatically producing cross-references, indices, etc. That is, if you have a directory containing a bunch of *reStructuredText* or *Markdown* documents, Sphinx can generate a series of HTML files, a PDF file (via LaTeX), man pages and much more.

Sphinx focuses on documentation, in particular handwritten documentation, however, Sphinx can also be used to generate blogs, homepages and even books. Much of Sphinx's power comes from the richness of its default plain-text markup format, *reStructuredText*, along with its *significant extensibility capabilities*.

The goal of this document is to give you a quick taste of what Sphinx is and how you might use it. When you're done here, you can check out the *installation guide* followed by the intro to the default markup format used by Sphinx, reStructuredText.

For a great "introduction" to writing docs in general – the whys and hows, see also Write the docs³, written by Eric Holscher.

1.1 Setting up the documentation sources

The root directory of a Sphinx collection of plain-text document sources is called the *source directory*. This directory also contains the Sphinx configuration file conf.py, where you can configure all aspects of how Sphinx reads your sources and builds your documentation.⁷

Sphinx comes with a script called **sphinx-quickstart** that sets up a source directory and creates a default **conf.py** with the most useful configuration values from a few questions it asks you. To use this, run:

\$ sphinx-quickstart

1.2 Defining document structure

Let's assume you've run **sphinx-quickstart**. It created a source directory with **conf.py** and a root document, **index.rst**. The main function of the *root document* is to serve as a welcome page, and to contain the root of the "table of contents tree" (or *toctree*). This is one of the main things that Sphinx adds to reStructuredText, a way to connect multiple files to a single hierarchy of documents.

³ https://www.writethedocs.org/guide/writing/beginners-guide-to-docs/

⁷ This is the usual layout. However, conf. py can also live in another directory, the *configuration directory*. Refer to the *sphinx-build man page* for more information.

reStructuredText directives

toctree is a reStructuredText *directive*, a very versatile piece of markup. Directives can have arguments, options and content.

Arguments are given directly after the double colon following the directive's name. Each directive decides whether it can have arguments, and how many.

Options are given after the arguments, in form of a "field list". The maxdepth is such an option for the toctree directive.

Content follows the options or arguments after a blank line. Each directive decides whether to allow content, and what to do with it.

A common gotcha with directives is that the first line of the content must be indented to the same level as the options are.

The toctree directive initially is empty, and looks like so:

```
.. toctree::
   :maxdepth: 2
```

You add documents listing them in the *content* of the directive:

```
.. toctree::
    :maxdepth: 2

    usage/installation
    usage/quickstart
    ...
```

This is exactly how the toctree for this documentation looks. The documents to include are given as *document names*, which in short means that you leave off the file name extension and use forward slashes (/) as directory separators.

Read more about the toctree directive.

You can now create the files you listed in the toctree and add content, and their section titles will be inserted (up to the maxdepth level) at the place where the toctree directive is placed. Also, Sphinx now knows about the order and hierarchy of your documents. (They may contain toctree directives themselves, which means you can create deeply nested hierarchies if necessary.)

1.3 Adding content

In Sphinx source files, you can use most features of standard *reStructuredText*. There are also several features added by Sphinx. For example, you can add cross-file references in a portable way (which works for all output types) using the *ref* role.

For an example, if you are viewing the HTML version, you can look at the source for this document – use the "Show Source" link in the sidebar.

Todo: Update the below link when we add new guides on these.

See reStructuredText for a more in-depth introduction to reStructuredText, including markup added by Sphinx.

1.4 Running the build

Now that you have added some files and content, let's make a first build of the docs. A build is started with the **sphinx-build** program:

```
$ sphinx-build -M html sourcedir outputdir
```

where *sourcedir* is the *source directory*, and *outputdir* is the directory in which you want to place the built documentation. The -M option selects a builder; in this example Sphinx will build HTML files.

Refer to the *sphinx-build man page* for all options that **sphinx-build** supports.

However, **sphinx-quickstart** script creates a Makefile and a make.bat which make life even easier for you. These can be executed by running **make** with the name of the builder. For example.

```
$ make html
```

This will build HTML docs in the build directory you chose. Execute **make** without an argument to see which targets are available.

How do I generate PDF documents?

make latexpdf runs the LaTeX builder and readily invokes the pdfTeX toolchain for you.

Todo: Move this whole section into a guide on rST or directives

1.5 Documenting objects

One of Sphinx's main objectives is easy documentation of *objects* (in a very general sense) in any *domain*. A domain is a collection of object types that belong together, complete with markup to create and reference descriptions of these objects.

The most prominent domain is the Python domain. For example, to document Python's built-in function enumerate(), you would add this to one of your source files.

```
.. py:function:: enumerate(sequence[, start=0])

Return an iterator that yields tuples of an index and an item of the
*sequence*. (And so on.)
```

This is rendered like this:

```
enumerate(sequence[, start=0])
```

Return an iterator that yields tuples of an index and an item of the sequence. (And so on.)

The argument of the directive is the *signature* of the object you describe, the content is the documentation for it. Multiple signatures can be given, each in its own line.

The Python domain also happens to be the default domain, so you don't need to prefix the markup with the domain name.

```
... function:: enumerate(sequence[, start=0])
...
```

does the same job if you keep the default setting for the default domain.

There are several more directives for documenting other types of Python objects, for example *py:class* or *py:method*. There is also a cross-referencing *role* for each of these object types. This markup will create a link to the documentation of enumerate().

```
The :py:func:`enumerate` function can be used for ...
```

And here is the proof: A link to enumerate().

Again, the py: can be left out if the Python domain is the default one. It doesn't matter which file contains the actual documentation for enumerate(); Sphinx will find it and create a link to it.

Each domain will have special rules for how the signatures can look like, and make the formatted output look pretty, or add specific features like links to parameter types, e.g. in the C/C++ domains.

See *Domains* for all the available domains and their directives/roles.

1.6 Basic configuration

Earlier we mentioned that the conf.py file controls how Sphinx processes your documents. In that file, which is executed as a Python source file, you assign configuration values. For advanced users: since it is executed by Sphinx, you can do non-trivial tasks in it, like extending sys.path⁴ or importing a module to find out the version you are documenting.

The config values that you probably want to change are already put into the conf.py by **sphinx-quickstart** and initially commented out (with standard Python syntax: a # comments the rest of the line). To change the default value, remove the hash sign and modify the value. To customize a config value that is not automatically added by **sphinx-quickstart**, just add an additional assignment.

Keep in mind that the file uses Python syntax for strings, numbers, lists and so on. The file is saved in UTF-8 by default, as indicated by the encoding declaration in the first line.

See *Configuration* for documentation of all available config values.

Todo: Move this entire doc to a different section

⁴ https://docs.python.org/3/library/sys.html#sys.path

1.7 Autodoc

When documenting Python code, it is common to put a lot of documentation in the source files, in documentation strings. Sphinx supports the inclusion of docstrings from your modules with an *extension* (an extension is a Python module that provides additional features for Sphinx projects) called *autodoc*.

In order to use *autodoc*, you need to activate it in conf.py by putting the string 'sphinx.ext.autodoc' into the list assigned to the *extensions* config value:

```
extensions = ['sphinx.ext.autodoc']
```

Then, you have a few additional directives at your disposal. For example, to document the function io.open(), reading its signature and docstring from the source file, you'd write this:

```
.. autofunction:: io.open
```

You can also document whole classes or even modules automatically, using member options for the auto directives, like

```
.. automodule:: io :members:
```

autodoc needs to import your modules in order to extract the docstrings. Therefore, you must add the appropriate path to sys.path⁵ in your conf.py.

Warning: *autodoc* **imports** the modules to be documented. If any modules have side effects on import, these will be executed by autodoc when sphinx-build is run.

If you document scripts (as opposed to library modules), make sure their main routine is protected by a if __name__ == '__main__' condition.

See *sphinx.ext.autodoc* for the complete description of the features of autodoc.

Todo: Move this doc to another section

1.8 Intersphinx

Many Sphinx documents including the Python documentation⁶ are published on the Internet. When you want to make links to such documents from your documentation, you can do it with *sphinx.ext.intersphinx*.

In order to use intersphinx, you need to activate it in conf.py by putting the string 'sphinx.ext.intersphinx' into the extensions list and set up the intersphinx_mapping config value.

For example, to link to io.open() in the Python library manual, you need to setup your *intersphinx_mapping* like:

```
intersphinx_mapping = {'python': ('https://docs.python.org/3', None)}
```

And now, you can write a cross-reference like :py:func:`io.open`. Any cross-reference that has no matching target in the current documentation set, will be looked up in the documentation sets configured in intersphinx_mapping

1.7. Autodoc 5

⁵ https://docs.python.org/3/library/sys.html#sys.path

⁶ https://docs.python.org/3

(this needs access to the URL in order to download the list of valid targets). Intersphinx also works for some other *domain*'s roles including :ref:, however it doesn't work for :doc: as that is non-domain role.

See *sphinx.ext.intersphinx* for the complete description of the features of intersphinx.

1.9 More topics to be covered

- Other extensions:
- Static files
- Selecting a theme
- Templating
- Using extensions
- Writing extensions

CHAPTER

TWO

INSTALLING SPHINX

- Overview
- Linux
- macOS
- Windows
- Installation from PyPI
- Docker
- Installation from source

2.1 Overview

Sphinx is written in Python⁸ and supports Python 3.9+. It builds upon the shoulders of many third-party libraries such as Docutils⁹ and Jinja¹⁰, which are installed when Sphinx is installed.

2.2 Linux

Debian/Ubuntu

Install either python3-sphinx using apt-get:

\$ apt-get install python3-sphinx

If it not already present, this will install Python for you.

⁸ https://docs.python-guide.org/

⁹ https://docutils.sourceforge.io/

¹⁰ https://jinja.palletsprojects.com/

RHEL, CentOS

Install python-sphinx using yum:

```
$ yum install python-sphinx
```

If it not already present, this will install Python for you.

Other distributions

Most Linux distributions have Sphinx in their package repositories. Usually the package is called python3-sphinx, python-sphinx or sphinx. Be aware that there are at least two other packages with sphinx in their name: a speech recognition toolkit (*CMU Sphinx*) and a full-text search database (*Sphinx search*).

2.3 macOS

Sphinx can be installed using Homebrew¹¹, MacPorts¹², or as part of a Python distribution such as Anaconda¹³.

Homebrew

```
$ brew install sphinx-doc
```

For more information, refer to the package overview¹⁴.

MacPorts

Install either python3x-sphinx using port:

```
sudo port install py39-sphinx
```

To set up the executable paths, use the port select command:

```
$ sudo port select --set python python39
$ sudo port select --set sphinx py39-sphinx
```

For more information, refer to the package overview¹⁵.

¹¹ https://brew.sh/

¹² https://www.macports.org/

¹³ https://www.anaconda.com/download/#macos

¹⁴ https://formulae.brew.sh/formula/sphinx-doc

¹⁵ https://www.macports.org/ports.php?by=library&substr=py39-sphinx

Anaconda

\$ conda install sphinx

2.4 Windows

Sphinx can be install using Chocolatey¹⁶ or *installed manually*.

Chocolatey

```
$ choco install sphinx
```

You would need to install Chocolatey¹⁷ before running this.

For more information, refer to the chocolatey page¹⁸.

Other Methods

Most Windows users do not have Python installed by default, so we begin with the installation of Python itself. To check if you already have Python installed, open the *Command Prompt* (\boxplus Win-r and type **cmd**). Once the command prompt is open, type **python** --**version** and press Enter. If Python is installed, you will see the version of Python printed to the screen. If you do not have Python installed, refer to the Hitchhikers Guide to Python's ¹⁹ Python on Windows installation guides. You must install Python 3²⁰.

Once Python is installed, you can install Sphinx using **pip**. Refer to the *pip installation instructions* below for more information.

2.5 Installation from PyPI

Sphinx packages are published on the Python Package Index²¹. The preferred tool for installing packages from PyPI is **pip**. This tool is provided with all modern versions of Python.

On Linux or MacOS, you should open your terminal and run the following command.

```
$ pip install -U sphinx
```

On Windows, you should open Command Prompt (⊞Win-r and type cmd) and run the same command.

```
C:\> pip install -U sphinx
```

After installation, type **sphinx-build --version** on the command prompt. If everything worked fine, you will see the version number for the Sphinx package you just installed.

Installation from *PyPI* also allows you to install the latest development release. You will not generally need (or want) to do this, but it can be useful if you see a possible bug in the latest stable release. To do this, use the --pre flag.

2.4. Windows 9

¹⁶ https://chocolatey.org/

¹⁷ https://chocolatey.org/install

¹⁸ https://chocolatey.org/packages/sphinx/

¹⁹ https://docs.python-guide.org/

²⁰ https://docs.python-guide.org/starting/install3/win/

²¹ https://pypi.org/project/Sphinx/

```
$ pip install -U --pre sphinx
```

Using virtual environments

When installing Sphinx using pip, it is highly recommended to use *virtual environments*, which isolate the installed packages from the system packages, thus removing the need to use administrator privileges. To create a virtual environment in the .venv directory, use the following command.

```
$ python -m venv .venv
```

You can read more about them in the Python Packaging User Guide²².

Warning: Note that in some Linux distributions, such as Debian and Ubuntu, this might require an extra installation step as follows.

```
$ apt-get install python3-venv
```

2.6 Docker

Docker images for Sphinx are published on the Docker Hub²³. There are two kind of images:

- sphinxdoc/sphinx²⁴
- sphinxdoc/sphinx-latexpdf²⁵

Former one is used for standard usage of Sphinx, and latter one is mainly used for PDF builds using LaTeX. Please choose one for your purpose.

Note: sphinxdoc/sphinx-latexpdf contains TeXLive packages. So the image is very large (over 2GB!).

Hint: When using docker images, please use **docker** run command to invoke sphinx commands. For example, you can use following command to create a Sphinx project:

```
$ docker run -it --rm -v /path/to/document:/docs sphinxdoc/sphinx sphinx-quickstart
```

And you can use the following command to build HTML document:

```
$ docker run --rm -v /path/to/document:/docs sphinxdoc/sphinx make html
```

For more details, please read README file²⁶ of docker images.

 $^{^{22}\} https://packaging.python.org/guides/installing-using-pip-and-virtual-environments/\#creating-a-virtual-environment$

²³ https://hub.docker.com/

²⁴ https://hub.docker.com/r/sphinxdoc/sphinx

²⁵ https://hub.docker.com/r/sphinxdoc/sphinx-latexpdf

²⁶ https://hub.docker.com/r/sphinxdoc/sphinx

2.7 Installation from source

You can install Sphinx directly from a clone of the Git repository²⁷. This can be done either by cloning the repo and installing from the local clone, on simply installing directly via **git**.

```
$ git clone https://github.com/sphinx-doc/sphinx
$ cd sphinx
$ pip install .
```

```
$ pip install git+https://github.com/sphinx-doc/sphinx
```

You can also download a snapshot of the Git repo in either $tar.gz^{28}$ or zip^{29} format. Once downloaded and extracted, these can be installed with pip as above.

²⁷ https://github.com/sphinx-doc/sphinx

²⁸ https://github.com/sphinx-doc/sphinx/archive/master.tar.gz

²⁹ https://github.com/sphinx-doc/sphinx/archive/master.zip

CHAPTER

THREE

TUTORIAL: BUILD YOUR FIRST PROJECT

In this tutorial you will build a simple documentation project using Sphinx, and view it in your browser as HTML. The project will include narrative, handwritten documentation, as well as autogenerated API documentation.

The tutorial is aimed towards Sphinx newcomers willing to learn the fundamentals of how projects are created and structured. You will create a fictional software library to generate random food recipes that will serve as a guide throughout the process, with the objective of properly documenting it.

To showcase Sphinx capabilities for code documentation you will use Python, which also supports *automatic* documentation generation.

Note: Several other languages are natively supported in Sphinx for *manual* code documentation, however they require extensions for *automatic* code documentation, like Breathe³⁰.

To follow the instructions you will need access to a Linux-like command line and a basic understanding of how it works, as well as a working Python installation for development, since you will use *Python virtual environments* to create the project.

3.1 Getting started

Setting up your project and development environment

In a new directory, create a file called README.rst with the following content.

Listing 1: README.rst

Lumache

Lumache (/lu'make/) is a Python library for cooks and food lovers that creates recipes mixing random ingredients.

It is a good moment to create a Python virtual environment and install the required tools. For that, open a command line terminal, cd into the directory you just created, and run the following commands:

```
$ python -m venv .venv
$ source .venv/bin/activate
(.venv) $ python -m pip install sphinx
```

³⁰ https://breathe.readthedocs.io/

Note: The installation method used above is described in more detail in *Installation from PyPI*. For the rest of this tutorial, the instructions will assume a Python virtual environment.

If you executed these instructions correctly, you should have the Sphinx command line tools available. You can do a basic verification running this command:

```
(.venv) $ sphinx-build --version sphinx-build 4.0.2
```

If you see a similar output, you are on the right path!

Creating the documentation layout

Then from the command line, run the following command:

```
(.venv) $ sphinx-quickstart docs
```

This will present to you a series of questions required to create the basic directory and configuration layout for your project inside the docs folder. To proceed, answer each question as follows:

- > Separate source and build directories (y/n) [n]: Write "y" (without quotes) and press Enter.
- > Project name: Write "Lumache" (without quotes) and press Enter.
- > Author name(s): Write "Graziella" (without quotes) and press Enter.
- > Project release []: Write "0.1" (without quotes) and press Enter.
- > Project language [en]: Leave it empty (the default, English) and press Enter.

After the last question, you will see the new docs directory with the following content.

The purpose of each of these files is:

build/

An empty directory (for now) that will hold the rendered documentation.

make.bat and Makefile

Convenience scripts to simplify some common Sphinx operations, such as rendering the content.

source/conf.py

A Python script holding the configuration of the Sphinx project. It contains the project name and release you specified to sphinx-quickstart, as well as some extra configuration keys.

source/index.rst

The *root document* of the project, which serves as welcome page and contains the root of the "table of contents tree" (or *toctree*).

Thanks to this bootstrapping step, you already have everything needed to render the documentation as HTML for the first time. To do that, run this command:

```
(.venv) $ sphinx-build -M html docs/source/ docs/build/
```

And finally, open docs/build/html/index.html in your browser. You should see something like this:

Fig. 1: Freshly created documentation of Lumache

There we go! You created your first HTML documentation using Sphinx. Now you can start customizing it.

3.2 First steps to document your project using Sphinx

Building your HTML documentation

The index.rst file that sphinx-quickstart created has some content already, and it gets rendered as the front page of your HTML documentation. It is written in reStructuredText, a powerful markup language.

Modify the file as follows:

Listing 2: docs/source/index.rst

This showcases several features of the reStructuredText syntax, including:

- a **section header** using === for the underline,
- two examples of *Inline markup*: **strong emphasis** (typically bold) and *emphasis* (typically italics),
- · an inline external link,
- and a note **admonition** (one of the available *directives*)

Now to render it with the new content, you can use the sphinx-build command as before, or leverage the convenience script as follows:

```
(.venv) $ cd docs
(.venv) $ make html
```

After running this command, you will see that index.html reflects the new changes!

Building your documentation in other formats

Sphinx supports a variety of formats apart from HTML, including PDF, EPUB, *and more*. For example, to build your documentation in EPUB format, run this command from the docs directory:

```
(.venv) $ make epub
```

After that, you will see the files corresponding to the e-book under docs/build/epub/. You can either open Lumache epub with an EPUB-compatible e-book viewer, like Calibre³¹, or preview index.xhtml on a web browser.

Note: To quickly display a complete list of possible output formats, plus some extra useful commands, you can run make help.

Each output format has some specific configuration options that you can tune, *including EPUB*. For instance, the default value of *epub_show_urls* is *inline*, which means that, by default, URLs are shown right after the corresponding link, in parentheses. You can change that behavior by adding the following code at the end of your conf.py:

```
# EPUB options
epub_show_urls = 'footnote'
```

With this configuration value, and after running make epub again, you will notice that URLs appear now as footnotes, which avoids cluttering the text. Sweet! Read on to explore *other ways to customize Sphinx*.

Note: Generating a PDF using Sphinx can be done running make latexpdf, provided that the system has a working LaTeX installation, as explained in the documentation of *sphinx.builders.latex.LaTeXBuilder*. Although this is perfectly feasible, such installations are often big, and in general LaTeX requires careful configuration in some cases, so PDF generation is out of scope for this tutorial.

3.3 More Sphinx customization

There are two main ways to customize your documentation beyond what is possible with core Sphinx: extensions and themes.

³¹ https://calibre-ebook.com/

Enabling a built-in extension

In addition to these configuration values, you can customize Sphinx even more by using *extensions*. Sphinx ships several *builtin ones*, and there are many more *maintained by the community*.

For example, to enable the *sphinx.ext.duration* extension, locate the extensions list in your conf.py and add one element as follows:

Listing 3: docs/source/conf.py

```
# Add any Sphinx extension module names here, as strings. They can be
# extensions coming with Sphinx (named 'sphinx.ext.*') or your custom
# ones.
extensions = [
    'sphinx.ext.duration',
]
```

After that, every time you generate your documentation, you will see a short durations report at the end of the console output, like this one:

Using a third-party HTML theme

Themes, on the other hand, are a way to customize the appearance of your documentation. Sphinx has several *builtin themes*, and there are also third-party ones³².

For example, to use the Furo³³ third-party theme in your HTML documentation, first you will need to install it with pip in your Python virtual environment, like this:

```
(.venv) $ pip install furo
```

And then, locate the html_theme variable on your conf.py and replace its value as follows:

Listing 4: docs/source/conf.py

```
# The theme to use for HTML and HTML Help pages. See the documentation for
# a list of builtin themes.
#
html_theme = 'furo'
```

With this change, you will notice that your HTML documentation has now a new appearance:

It is now time to expand the narrative documentation and split it into several documents.

³² https://sphinx-themes.org/

³³ https://pradyunsg.me/furo/

Fig. 2: HTML documentation of Lumache with the Furo theme

3.4 Narrative documentation in Sphinx

Structuring your documentation across multiple pages

The file index.rst created by sphinx-quickstart is the *root document*, whose main function is to serve as a welcome page and to contain the root of the "table of contents tree" (or *toctree*). Sphinx allows you to assemble a project from different files, which is helpful when the project grows.

As an example, create a new file docs/source/usage.rst (next to index.rst) with these contents:

Listing 5: docs/source/usage.rst

```
Usage
=====
Installation
-----
To use Lumache, first install it using pip:
.. code-block:: console
   (.venv) $ pip install lumache
```

This new file contains two *section* headers, normal paragraph text, and a *code-block* directive that renders a block of content as source code, with appropriate syntax highlighting (in this case, generic console text).

The structure of the document is determined by the succession of heading styles, which means that, by using --- for the "Installation" section after === for the "Usage" section, you have declared "Installation" to be a *subsection* of "Usage".

To complete the process, add a toctree *directive* at the end of index.rst including the document you just created, as follows:

Listing 6: docs/source/index.rst

| Contents | |
|----------|-------------|
| | |
| | toctree:: |
| | usage |

This step inserts that document in the root of the *toctree*, so now it belongs to the structure of your project, which so far looks like this:

```
index
└─ usage
```

If you build the HTML documentation running make html, you will see that the toctree gets rendered as a list of hyperlinks, and this allows you to navigate to the new page you just created. Neat!

Warning: Documents outside a *toctree* will result in WARNING: document isn't included in any toctree messages during the build process, and will be unreachable for users.

Adding cross-references

One powerful feature of Sphinx is the ability to seamlessly add *cross-references* to specific parts of the documentation: a document, a section, a figure, a code object, etc. This tutorial is full of them!

To add a cross-reference, write this sentence right after the introduction paragraph in index.rst:

Listing 7: docs/source/index.rst

```
Check out the :doc:`usage` section for further information.
```

The *doc role* you used automatically references a specific document in the project, in this case the usage.rst you created earlier.

Alternatively, you can also add a cross-reference to an arbitrary part of the project. For that, you need to use the ref role, and add an explicit *label* that acts as a target³⁴.

For example, to reference the "Installation" subsection, add a label right before the heading, as follows:

Listing 8: docs/source/usage.rst

And make the sentence you added in index.rst look like this:

Listing 9: docs/source/index.rst

```
Check out the :doc:`usage` section for further information, including how to :ref:`install <installation>` the project.
```

Notice a trick here: the install part specifies how the link will look like (we want it to be a specific word, so the sentence makes sense), whereas the <installation> part refers to the actual label we want to add a cross-reference to.

³⁴ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#hyperlink-targets

If you do not include an explicit title, hence using :ref:`installation`, the section title will be used (in this case, Installation). Both the :doc: and the :ref: roles will be rendered as hyperlinks in the HTML documentation.

What about documenting code objects in Sphinx? Read on!

3.5 Describing code in Sphinx

In the *previous sections of the tutorial* you can read how to write narrative or prose documentation in Sphinx. In this section you will describe code objects instead.

Sphinx supports documenting code objects in several languages, namely Python, C, C++, JavaScript, and reStructured-Text. Each of them can be documented using a series of directives and roles grouped by *domain*. For the remainder of the tutorial you will use the Python domain, but all the concepts seen in this section apply for the other domains as well

Python

Documenting Python objects

Sphinx offers several roles and directives to document Python objects, all grouped together in *the Python domain*. For example, you can use the *py:function* directive to document a Python function, as follows:

Listing 10: docs/source/usage.rst

```
Creating recipes
-----
To retrieve a list of random ingredients,
you can use the ``lumache.get_random_ingredients()`` function:
.. py:function:: lumache.get_random_ingredients(kind=None)

Return a list of random ingredients as strings.

:param kind: Optional "kind" of ingredients.
:type kind: list[str] or None
:return: The ingredients list.
:rtype: list[str]
```

Which will render like this:

Notice several things:

- Sphinx parsed the argument of the .. py:function directive and highlighted the module, the function name, and the parameters appropriately.
- The directive content includes a one-line description of the function, as well as an *info field list* containing the function parameter, its expected type, the return value, and the return type.

Note: The py: prefix specifies the *domain*. You may configure the default domain so you can omit the prefix, either globally using the *primary_domain* configuration, or use the *default-domain* directive to change it from the point it is called until the end of the file. For example, if you set it to py (the default), you can write . . function:: directly.

Creating recipes

To retrieve a list of random ingredients, you can use the <code>lumache.get_random_ingredients()</code> function:

```
| Iumache.get_random_ingredients(kind=None)
| Return a list of random ingredients as strings.
| PARAMETERS | kind (list[str] or None) - Optional "kind" of ingredients.
| RETURNS | The ingredients list.
| RETURN TYPE | list[str]
```

Fig. 3: The rendered result of documenting a Python function in Sphinx

Cross-referencing Python objects

By default, most of these directives generate entities that can be cross-referenced from any part of the documentation by using *a corresponding role*. For the case of functions, you can use *py:func* for that, as follows:

Listing 11: docs/source/usage.rst

```
The ``kind`` parameter should be either ``"meat"``, ``"fish"``, or ``"veggies"``. Otherwise, :py:func:`lumache.get_random_ingredients` will raise an exception.
```

When generating code documentation, Sphinx will generate a cross-reference automatically just by using the name of the object, without you having to explicitly use a role for that. For example, you can describe the custom exception raised by the function using the *py:exception* directive:

Listing 12: docs/source/usage.rst

```
.. py:exception:: lumache.InvalidKindError

Raised if the kind is invalid.
```

Then, add this exception to the original description of the function:

Listing 13: docs/source/usage.rst

```
.. py:function:: lumache.get_random_ingredients(kind=None)

Return a list of random ingredients as strings.

:param kind: Optional "kind" of ingredients.
:type kind: list[str] or None
:raise lumache.InvalidKindError: If the kind is invalid.
:return: The ingredients list.
:rtype: list[str]
```

And finally, this is how the result would look:

Creating recipes

```
To retrieve a list of random ingredients, you can use the <code>lumache.get_random_ingredients()</code> function: <code>lumache.get_random_ingredients(kind=None)</code>

Return a list of random ingredients as strings.
```

PARAMETERS **kind** (*list[str] or None*) – Optional "kind" of ingredients.

RAISES

lumache.InvalidKindError - If the kind is invalid.

RETURNS

The ingredients list.

RETURN TYPE list[str]

The kind parameter should be either "meat", "fish", or "veggies". Otherwise, lumache.get_random_ingredients() will raise an exception.

exception lumache.InvalidKindError

Raised if the kind is invalid.

Fig. 4: HTML result of documenting a Python function in Sphinx with cross-references

Beautiful, isn't it?

Including doctests in your documentation

Since you are now describing code from a Python library, it will become useful to keep both the documentation and the code as synchronized as possible. One of the ways to do that in Sphinx is to include code snippets in the documentation, called *doctests*, that are executed when the documentation is built.

To demonstrate doctests and other Sphinx features covered in this tutorial, Sphinx will need to be able to import the code. To achieve that, write this at the beginning of conf.py:

Listing 14: docs/source/conf.py

```
# If extensions (or modules to document with autodoc) are in another directory,
# add these directories to sys.path here.
import pathlib
import sys
sys.path.insert(0, pathlib.Path(__file__).parents[2].resolve().as_posix())
```

Note: An alternative to changing the sys.path³⁵ variable is to create a pyproject.toml file and make the code installable, so it behaves like any other Python library. However, the sys.path approach is simpler.

Then, before adding doctests to your documentation, enable the *doctest* extension in conf.py:

³⁵ https://docs.python.org/3/library/sys.html#sys.path

Listing 15: docs/source/conf.py

```
extensions = [
    'sphinx.ext.duration',
    'sphinx.ext.doctest',
]
```

Next, write a doctest block as follows:

Listing 16: docs/source/usage.rst

```
>>> import lumache
>>> lumache.get_random_ingredients()
['shells', 'gorgonzola', 'parsley']
```

Doctests include the Python instructions to be run preceded by >>>, the standard Python interpreter prompt, as well as the expected output of each instruction. This way, Sphinx can check whether the actual output matches the expected one

To observe how a doctest failure looks like (rather than a code error as above), let's write the return value incorrectly first. Therefore, add a function get_random_ingredients like this:

Listing 17: lumache.py

```
def get_random_ingredients(kind=None):
   return ["eggs", "bacon", "spam"]
```

You can now run make doctest to execute the doctests of your documentation. Initially this will display an error, since the actual code does not behave as specified:

As you can see, doctest reports the expected and the actual results, for easy examination. It is now time to fix the function:

Listing 18: lumache.py

```
def get_random_ingredients(kind=None):
    return ["shells", "gorgonzola", "parsley"]
```

And finally, make doctest reports success!

For big projects though, this manual approach can become a bit tedious. In the next section, you will see *how to automate the process*.

Other languages (C, C++, others)

Documenting and cross-referencing objects

Sphinx also supports documenting and cross-referencing objects written in other programming languages. There are four additional built-in domains: C, C++, JavaScript, and reStructuredText. Third-party extensions may define domains for more languages, such as

- Fortran³⁶,
- Julia³⁷, or
- PHP³⁸.

For example, to document a C++ type definition, you would use the built-in cpp: type directive, as follows:

```
.. cpp:type:: std::vector<int> CustomList

A typedef-like declaration of a type.
```

Which would give the following result:

typedef std::vector<int> CustomList

A typedef-like declaration of a type.

All such directives then generate references that can be cross-referenced by using the corresponding role. For example, to reference the previous type definition, you can use the *cpp:type* role as follows:

```
Cross reference to :cpp:type:`CustomList`.
```

Which would produce a hyperlink to the previous definition: CustomList.

3.6 Automatic documentation generation from code

In the *previous section* of the tutorial you manually documented a Python function in Sphinx. However, the description was out of sync with the code itself, since the function signature was not the same. Besides, it would be nice to reuse **Python docstrings**³⁹ in the documentation, rather than having to write the information in two places.

Fortunately, the autodoc extension provides this functionality.

³⁶ https://sphinx-fortran.readthedocs.io

³⁷ https://bastikr.github.io/sphinx-julia

³⁸ https://github.com/markstory/sphinxcontrib-phpdomain

³⁹ https://peps.python.org/pep-0257/#what-is-a-docstring

Reusing signatures and docstrings with autodoc

To use autodoc, first add it to the list of enabled extensions:

Listing 19: docs/source/conf.py

```
extensions = [
    'sphinx.ext.duration',
    'sphinx.ext.doctest',
    'sphinx.ext.autodoc',
]
```

Next, move the content of the .. py:function directive to the function docstring in the original Python file, as follows:

Listing 20: lumache.py

```
def get_random_ingredients(kind=None):
    """
    Return a list of random ingredients as strings.

    :param kind: Optional "kind" of ingredients.
    :type kind: list[str] or None
    :raise lumache.InvalidKindError: If the kind is invalid.
    :return: The ingredients list.
    :rtype: list[str]
    """
    return ["shells", "gorgonzola", "parsley"]
```

Finally, replace the .. py:function directive from the Sphinx documentation with autofunction:

Listing 21: docs/source/usage.rst

```
you can use the ``lumache.get_random_ingredients()`` function:
.. autofunction:: lumache.get_random_ingredients
```

If you now build the HTML documentation, the output will be the same! With the advantage that it is generated from the code itself. Sphinx took the reStructuredText from the docstring and included it, also generating proper cross-references.

You can also autogenerate documentation from other objects. For example, add the code for the InvalidKindError exception:

Listing 22: lumache.py

```
class InvalidKindError(Exception):
    """Raised if the kind is invalid."""
    pass
```

And replace the .. py:exception directive with autoexception as follows:

Listing 23: docs/source/usage.rst

```
or ``"veggies"``. Otherwise, :py:func:`lumache.get_random_ingredients`
will raise an exception.
.. autoexception:: lumache.InvalidKindError
```

And again, after running make html, the output will be the same as before.

Generating comprehensive API references

While using sphinx.ext.autodoc makes keeping the code and the documentation in sync much easier, it still requires you to write an auto* directive for every object you want to document. Sphinx provides yet another level of automation: the *autosummary* extension.

The *autosummary* directive generates documents that contain all the necessary autodoc directives. To use it, first enable the autosummary extension:

Listing 24: docs/source/conf.py

```
extensions = [
  'sphinx.ext.duration',
  'sphinx.ext.doctest',
  'sphinx.ext.autodoc',
  'sphinx.ext.autosummary',
]
```

Next, create a new api.rst file with these contents:

Listing 25: docs/source/api.rst

```
API ===

.. autosummary::
    :toctree: generated

lumache
```

Remember to include the new document in the root toctree:

Listing 26: docs/source/index.rst

```
Contents
-----
.. toctree::

usage
api
```

Finally, after you build the HTML documentation running make html, it will contain two new pages:

• api.html, corresponding to docs/source/api.rst and containing a table with the objects you included in the autosummary directive (in this case, only one).

• generated/lumache.html, corresponding to a newly created reST file generated/lumache.rst and containing a summary of members of the module, in this case one function and one exception.

lumache

Lumache - Python library for cooks and food lovers.

FUNCTIONS

get_random_ingredients ([kind]) Return a list of random ingredients as strings.

EXCEPTIONS

InvalidKindError Raised if the kind is invalid.

Fig. 5: Summary page created by autosummary

Each of the links in the summary page will take you to the places where you originally used the corresponding autodoc directive, in this case in the usage.rst document.

Note: The generated files are based on Jinja2 templates⁴⁰ that *can be customized*, but that is out of scope for this tutorial.

3.7 Appendix: Deploying a Sphinx project online

When you are ready to show your documentation project to the world, there are many options available to do so. Since the HTML generated by Sphinx is static, you can decouple the process of building your HTML documentation from hosting such files in the platform of your choice. You will not need a sophisticated server running Python: virtually every web hosting service will suffice.

Therefore, the challenge is less how or where to serve the static HTML, but rather how to pick a workflow that automatically updates the deployed documentation every time there is a change in the source files.

The following sections describe some of the available options to deploy your online documentation, and give some background information. If you want to go directly to the practical part, you can skip to *Publishing your documentation sources*.

⁴⁰ https://jinja.palletsprojects.com/

Sphinx-friendly deployment options

There are several possible options you have to host your Sphinx documentation. Some of them are:

Read the Docs

Read the Docs⁴¹ is an online service specialized in hosting technical documentation written in Sphinx, as well as MkDocs. They have a number of extra features, such as versioned documentation, traffic and search analytics, custom domains, user-defined redirects, and more.

GitHub Pages

GitHub Pages⁴² is a simple static web hosting tightly integrated with GitHub⁴³: static HTML is served from one of the branches of a project, and usually sources are stored in another branch so that the output can be updated every time the sources change (for example using GitHub Actions⁴⁴). It is free to use and supports custom domains.

GitLab Pages

GitLab Pages⁴⁵ is a similar concept to GitHub Pages, integrated with GitLab⁴⁶ and usually automated with GitLab CI⁴⁷ instead.

Netlify

Netlify⁴⁸ is a sophisticated hosting for static sites enhanced by client-side web technologies like JavaScript (so-called "Jamstack", 1999). They offer support for headless content management systems and serverless computing.

Your own server

You can always use your own web server to host Sphinx HTML documentation. It is the option that gives more flexibility, but also more complexity.

All these options have zero cost, with the option of paying for extra features.

Embracing the "Docs as Code" philosophy

The free offerings of most of the options listed above require your documentation sources to be publicly available. Moreover, these services expect you to use a Version Control System⁵⁰, a technology that tracks the evolution of a collection of files as a series of snapshots ("commits"). The practice of writing documentation in plain text files with the same tools as the ones used for software development is commonly known as "Docs as Code"⁵¹.

The most popular Version Control System nowadays is Git⁵², a free and open source tool that is the backbone of services like GitHub and GitLab. Since both Read the Docs and Netlify have integrations with GitHub and GitLab, and both GitHub and GitLab have an integrated Pages product, the most effective way of automatically build your documentation online is to upload your sources to either of these Git hosting services.

- 52 https://git-scm.com/

Publishing your documentation sources

GitHub

The quickest way to upload an existing project to GitHub is to:

- 1. Sign up for a GitHub account⁵³.
- 2. Create a new repository⁵⁴.
- 3. Open the "Upload files" page⁵⁵ of your new repository.
- 4. Select the files on your operating system file browser (in your case README.rst, lumache.py, the makefiles under the docs directory, and everything under docs/source) and drag them to the GitHub interface to upload them all.
- 5. Click on the Commit changes button.

Note: Make sure you don't upload the docs/build directory, as it contains the output generated by Sphinx and it will change every time you change the sources, complicating your workflow.

These steps do not require access to the command line or installing any additional software. To learn more, you can:

- Follow this interactive GitHub course⁵⁶ to learn more about how the GitHub interface works.
- Read this quickstart tutorial⁵⁷ to install extra software on your machine and have more flexibility. You can either use the Git command line, or the GitHub Desktop application.

GitLab

Similarly to GitHub, the fastest way to upload your project to GitLab is using the web interface:

- 1. Sign up for a GitLab account⁵⁸.
- 2. Create a new blank project⁵⁹.
- 3. Upload the project files (in your case README.rst, lumache.py, the makefiles under the docs directory, and everything under docs/source) one by one using the *Upload File* button⁶².

Again, these steps do not require additional software on your computer. To learn more, you can:

- Follow this tutorial⁶⁰ to install Git on your machine.
- Browse the GitLab User documentation⁶¹ to understand the possibilities of the platform.

Note: Make sure you don't upload the docs/build directory, as it contains the output generated by Sphinx and it will change every time you change the sources, complicating your workflow.

```

⁵⁷ https://docs.github.com/en/get-started/quickstart

⁵⁸ https://gitlab.com/users/sign_up

⁵⁹ https://gitlab.com/projects/new

⁶² At the time of writing, uploading whole directories to GitLab using only the web interface⁶³ is not yet implemented.

⁶³ https://gitlab.com/gitlab-org/gitlab/-/issues/228490

⁶⁰ https://docs.gitlab.com/ee/gitlab-basics/start-using-git.html

⁶¹ https://docs.gitlab.com/ee/user/index.html

Publishing your HTML documentation

Read the Docs

Read the $Docs^{64}$ offers integration with both GitHub and GitLab. The quickest way of getting started is to follow the RTD tutorial⁶⁵, which is loosely based on this one. You can publish your sources on GitHub as explained *in the previous section*, then skip directly to Sign up for Read the $Docs^{66}$. If you choose GitLab instead, the process is similar.

GitHub Pages

GitHub Pages⁶⁷ requires you to *publish your sources* on GitHub⁶⁸. After that, you will need an automated process that performs the make html step every time the sources change. That can be achieved using GitHub Actions⁶⁹.

After you have published your sources on GitHub, create a file named .github/workflows/sphinx.yml in your repository with the following contents:

Listing 27: .github/workflows/

```
name: "Sphinx: Render docs"
on: push
jobs:
  build:
    runs-on: ubuntu-latest
    permissions:
      contents: write
    steps:
    - uses: actions/checkout@v4
    - name: Build HTML
      uses: ammaraskar/sphinx-action@master

    name: Upload artifacts

      uses: actions/upload-artifact@v4
      with:
        name: html-docs
        path: docs/build/html/
    - name: Deploy
      uses: peaceiris/actions-gh-pages@v3
      if: github.ref == 'refs/heads/main'
        github_token: ${{ secrets.GITHUB_TOKEN }}
        publish_dir: docs/build/html
```

This contains a GitHub Actions workflow with a single job of four steps:

- 1. Checkout the code.
- 2. Build the HTML documentation using Sphinx.
- 3. Attach the HTML output the artifacts to the GitHub Actions job, for easier inspection.

⁶⁴ https://readthedocs.org/

⁶⁵ https://docs.readthedocs.io/en/stable/tutorial/index.html

⁶⁶ https://docs.readthedocs.io/en/stable/tutorial/index.html#sign-up-for-read-the-docs

⁶⁷ https://pages.github.com/

⁶⁸ https://github.com/

⁶⁹ https://github.com/features/actions

4. If the change happens on the default branch, take the contents of docs/build/html and push it to the gh-pages branch.

Next, you need to specify the dependencies for the make html step to be successful. For that, create a file docs/requirements.txt and add the following contents:

Listing 28: docs/requirements.txt

```
furo==2021.11.16
```

And finally, you are ready to enable GitHub Pages on your repository⁷⁰. For that, go to *Settings*, then *Pages* on the left sidebar, select the gh-pages branch in the "Source" dropdown menu, and click *Save*. After a few minutes, you should be able to see your HTML at the designated URL.

GitLab Pages

GitLab Pages⁷¹, on the other hand, requires you to *publish your sources* on GitLab⁷². When you are ready, you can automate the process of running make html using GitLab CI⁷³.

After you have published your sources on GitLab, create a file named .gitlab-ci.yml in your repository with these contents:

Listing 29: .gitlab-ci.yml

```
stages:
  - deploy
pages:
  stage: deploy
  image: python:3.9-slim
  before_script:
    - apt-get update && apt-get install make --no-install-recommends -y
    - python -m pip install sphinx furo
  script:
    - cd docs && make html
  after_script:
    - mv docs/build/html/ ./public/
  artifacts:
    paths:
    - public
  rules:
    - if: $CI_COMMIT_REF_NAME == $CI_DEFAULT_BRANCH
```

This contains a GitLab CI workflow with one job of several steps:

- 1. Install the necessary dependencies.
- 2. Build the HTML documentation using Sphinx.
- 3. Move the output to a known artifacts location.

 $^{^{70}\} https://docs.github.com/en/pages/getting-started-with-github-pages/configuring-a-publishing-source-for-your-github-pages-site$

⁷¹ https://about.gitlab.com/stages-devops-lifecycle/pages/

⁷² https://gitlab.com/

⁷³ https://about.gitlab.com/stages-devops-lifecycle/continuous-integration/

Note: You will need to validate your account⁷⁴ by entering a payment method (you will be charged a small amount that will then be reimbursed).

After that, if the pipeline is successful, you should be able to see your HTML at the designated URL.

3.8 Where to go from here

This tutorial covered the very first steps to create a documentation project with Sphinx. To continue learning more about Sphinx, check out the rest of the documentation.

CHAPTER

FOUR

USING SPHINX

This guide serves to demonstrate how one can get started with Sphinx and covers everything from installing Sphinx and configuring your first Sphinx project to using some of the advanced features Sphinx provides out-of-the-box. If you are looking for guidance on extending Sphinx, refer to *Writing Sphinx Extensions*.

4.1 reStructuredText

reStructuredText (reST) is the default plaintext markup language used by both Docutils and Sphinx. Docutils provides the basic reStructuredText syntax, while Sphinx extends this to support additional functionality.

The below guides go through the most important aspects of reST. For the authoritative reStructuredText reference, refer to the docutils documentation⁷⁵.

reStructuredText Primer

reStructuredText is the default plaintext markup language used by Sphinx. This section is a brief introduction to re-StructuredText (reST) concepts and syntax, intended to provide authors with enough information to author documents productively. Since reST was designed to be a simple, unobtrusive markup language, this will not take too long.

See also:

The authoritative reStructuredText User Documentation⁷⁶. The "ref" links in this document link to the description of the individual constructs in the reST reference.

Paragraphs

The paragraph (ref⁷⁷) is the most basic block in a reST document. Paragraphs are simply chunks of text separated by one or more blank lines. As in Python, indentation is significant in reST, so all lines of the same paragraph must be left-aligned to the same level of indentation.

⁷⁵ https://docutils.sourceforge.io/rst.html

⁷⁶ https://docutils.sourceforge.io/rst.html

⁷⁷ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#paragraphs

Inline markup

The standard reST inline markup is quite simple: use

- one asterisk: *text* for emphasis (italics),
- two asterisks: **text** for strong emphasis (boldface), and
- backquotes: ``text`` for code samples.

If asterisks or backquotes appear in running text and could be confused with inline markup delimiters, they have to be escaped with a backslash.

Be aware of some restrictions of this markup:

- it may not be nested,
- content may not start or end with whitespace: * text* is wrong,
- it must be separated from surrounding text by non-word characters. Use a backslash escaped space to work around that: thisis\ *one*\ word.

These restrictions may be lifted in future versions of the docutils.

It is also possible to replace or expand upon some of this inline markup with roles. Refer to *Roles* for more information.

Lists and Quote-like blocks

List markup (ref⁷⁸) is natural: just place an asterisk at the start of a paragraph and indent properly. The same goes for numbered lists; they can also be autonumbered using a # sign:

```
* This is a bulleted list.
* It has two items, the second item uses two lines.
1. This is a numbered list.
2. It has two items too.
#. This is a numbered list.
#. It has two items too.
```

Nested lists are possible, but be aware that they must be separated from the parent list items by blank lines:

```
* this is
* a list

* with a nested list
* and some subitems

* and here the parent list continues
```

Definition lists (ref⁷⁹) are created as follows:

```
term (up to a line of text)

Definition of the term, which must be indented

(continues on next page)
```

 $^{^{78}\} https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html\#bullet-lists$

⁷⁹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#definition-lists

(continued from previous page)

```
and can even consist of multiple paragraphs
next term
Description.
```

Note that the term cannot have more than one line of text.

Quoted paragraphs (ref⁸⁰) are created by just indenting them more than the surrounding paragraphs.

Line blocks (ref⁸¹) are a way of preserving line breaks:

```
| These lines are
| broken exactly like in
| the source file.
```

There are also several more special blocks available:

- field lists (ref⁸², with caveats noted in *Field Lists*)
- option lists (ref⁸³)
- quoted literal blocks (ref⁸⁴)
- doctest blocks (ref⁸⁵)

Literal blocks

Literal code blocks (ref⁸⁶) are introduced by ending a paragraph with the special marker ::. The literal block must be indented (and, like all paragraphs, separated from the surrounding ones by blank lines):

```
This is a normal text paragraph. The next paragraph is a code sample::

It is not processed in any way, except that the indentation is removed.

It can span multiple lines.

This is a normal text paragraph again.
```

The handling of the :: marker is smart:

- If it occurs as a paragraph of its own, that paragraph is completely left out of the document.
- If it is preceded by whitespace, the marker is removed.
- If it is preceded by non-whitespace, the marker is replaced by a single colon.

That way, the second sentence in the above example's first paragraph would be rendered as "The next paragraph is a code sample:".

⁸⁰ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#block-quotes

⁸¹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#line-blocks

⁸² https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#field-lists

⁸³ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#option-lists

⁸⁴ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#quoted-literal-blocks

⁸⁵ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#doctest-blocks

⁸⁶ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#literal-blocks

Code highlighting can be enabled for these literal blocks on a document-wide basis using the *highlight* directive and on a project-wide basis using the *highlight_language* configuration option. The *code-block* directive can be used to set highlighting on a block-by-block basis. These directives are discussed later.

Doctest blocks

Doctest blocks (ref⁸⁷) are interactive Python sessions cut-and-pasted into docstrings. They do not require the *literal blocks* syntax. The doctest block must end with a blank line and should *not* end with an unused prompt:

```
>>> 1 + 1
2
```

Tables

For grid tables (ref⁸⁸), you have to "paint" the cell grid yourself. They look like this:

Simple tables (ref⁸⁹) are easier to write, but limited: they must contain more than one row, and the first column cells cannot contain multiple lines. They look like this:

Two more syntaxes are supported: *CSV tables* and *List tables*. They use an *explicit markup block*. Refer to *Tables* for more information.

 $^{^{87}\} https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html\#doctest-blocks$

⁸⁸ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#grid-tables

⁸⁹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#simple-tables

Hyperlinks

External links

Use `Link text Link text should be the web address, you don't need special markup at all, the parser finds links and mail addresses in ordinary text.

Important: There must be a space between the link text and the opening < for the URL.

You can also separate the link and the target definition (ref⁹⁰), like this:

```
This is a paragraph that contains `a link`_.

.. _a link: https://domain.invalid/
```

Internal links

Internal linking is done via a special reST role provided by Sphinx, see the section on specific markup, *Cross-referencing arbitrary locations*.

Sections

Section headers (ref⁹¹) are created by underlining (and optionally overlining) the section title with a punctuation character, at least as long as the text:

```
This is a heading
```

Normally, there are no heading levels assigned to certain characters as the structure is determined from the succession of headings. However, this convention is used in Python Developer's Guide for documenting⁹² which you may follow:

- # with overline, for parts
- * with overline, for chapters
- = for sections
- · for subsections
- · ^ for subsubsections
- " for paragraphs

Of course, you are free to use your own marker characters (see the reST documentation), and use a deeper nesting level, but keep in mind that most target formats (HTML, LaTeX) have a limited supported nesting depth.

⁹⁰ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#hyperlink-targets

⁹¹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#sections

⁹² https://devguide.python.org/documentation/markup/#sections

Field Lists

Field lists (ref⁹³) are sequences of fields marked up like this:

```
:fieldname: Field content
```

They are commonly used in Python documentation:

```
def my_function(my_arg, my_other_arg):
    """A function just for me.

    :param my_arg: The first of my arguments.
    :param my_other_arg: The second of my arguments.

    :returns: A message (just for me, of course).
    """
```

Sphinx extends standard docutils behavior and intercepts field lists specified at the beginning of documents. Refer to *Field Lists* for more information.

Roles

A role or "custom interpreted text role" (ref⁹⁴) is an inline piece of explicit markup. It signifies that the enclosed text should be interpreted in a specific way. Sphinx uses this to provide semantic markup and cross-referencing of identifiers, as described in the appropriate section. The general syntax is :rolename:`content`.

Docutils supports the following roles:

- emphasis 95 equivalent of *emphasis*
- strong⁹⁶ equivalent of **strong**
- literal⁹⁷ equivalent of ``literal``
- subscript ⁹⁸ subscript text
- superscript ⁹⁹ superscript text
- title-reference 100 for titles of books, periodicals, and other materials

Refer to *Roles* for roles added by Sphinx.

⁹³ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#field-lists

⁹⁴ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#roles

⁹⁸ https://docutils.sourceforge.io/docs/ref/rst/roles.html#subscript

⁹⁹ https://docutils.sourceforge.io/docs/ref/rst/roles.html#superscript

¹⁰⁰ https://docutils.sourceforge.io/docs/ref/rst/roles.html#title-reference

Explicit Markup

"Explicit markup" (ref¹⁰¹) is used in reST for most constructs that need special handling, such as footnotes, specially-highlighted paragraphs, comments, and generic directives.

An explicit markup block begins with a line starting with .. followed by whitespace and is terminated by the next paragraph at the same level of indentation. (There needs to be a blank line between explicit markup and normal paragraphs. This may all sound a bit complicated, but it is intuitive enough when you write it.)

Directives

A directive (ref¹⁰²) is a generic block of explicit markup. Along with roles, it is one of the extension mechanisms of reST, and Sphinx makes heavy use of it.

Docutils supports the following directives:

- Admonitions: attention¹⁰³, caution¹⁰⁴, danger¹⁰⁵, error¹⁰⁶, hint¹⁰⁷, important¹⁰⁸, note¹⁰⁹, tip¹¹⁰, warning¹¹¹ and the generic admonition¹¹². (Most themes style only "note" and "warning" specially.)
- Images:
 - image¹¹³ (see also *Images* below)
 - figure 114 (an image with caption and optional legend)
- Additional body elements:
 - contents¹¹⁵ (a local, i.e. for the current file only, table of contents)
 - container 116 (a container with a custom class, useful to generate an outer <div> in HTML)
 - rubric¹¹⁷ (a heading without relation to the document sectioning)
 - topic¹¹⁸, sidebar¹¹⁹ (special highlighted body elements)
 - parsed-literal 120 (literal block that supports inline markup)
 - epigraph¹²¹ (a block quote with optional attribution line)
 - highlights¹²², pull-quote¹²³ (block quotes with their own class attribute)

¹²² https://docutils.sourceforge.io/docs/ref/rst/directives.html#highlights

¹²³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#pull-quote

- compound¹²⁴ (a compound paragraph)
- · Special tables:
 - table 125 (a table with title)
 - csv-table¹²⁶ (a table generated from comma-separated values)
 - list-table 127 (a table generated from a list of lists)
- Special directives:
 - raw¹²⁸ (include raw target-format markup)
 - include ¹²⁹ (include reStructuredText from another file) in Sphinx, when given an absolute include file path, this directive takes it as relative to the source directory
 - class 130 (assign a class attribute to the next element)

Note: When the default domain contains a class directive, this directive will be shadowed. Therefore, Sphinx re-exports it as rst-class.

- HTML specifics:
 - meta¹³¹ (generation of HTML <meta> tags, see also HTML Metadata below)
 - title¹³² (override document title)
- Influencing markup:
 - default-role¹³³ (set a new default role)
 - role¹³⁴ (create a new role)

Since these are only per-file, better use Sphinx's facilities for setting the *default_role*.

```
Warning: Do not use the directives sectnum<sup>135</sup>, header<sup>136</sup> and footer<sup>137</sup>.
```

Directives added by Sphinx are described in *Directives*.

Basically, a directive consists of a name, arguments, options and content. (Keep this terminology in mind, it is used in the next chapter describing custom directives.) Looking at this example,

¹²⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#compound-paragraph

https://docutils.sourceforge.io/docs/ref/rst/directives.html#table

¹³⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#role

¹³⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#sectnum

¹³⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html#header

¹³⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#footer

(continued from previous page)

Return a line of text input from the user.

function is the directive name. It is given two arguments here, the remainder of the first line and the second line, as well as one option module (as you can see, options are given in the lines immediately following the arguments and indicated by the colons). Options must be indented to the same level as the directive content.

The directive content follows after a blank line and is indented relative to the directive start or if options are present, by the same amount as the options.

Be careful as the indent is not a fixed number of whitespace, e.g. three, but any number whitespace. This can be surprising when a fixed indent is used throughout the document and can make a difference for directives which are sensitive to whitespace. Compare:

```
.. code-block::
    :caption: A cool example

    The output of this line starts with four spaces.
.. code-block::
    The output of this line has no spaces at the beginning.
```

In the first code block, the indent for the content was fixated by the option line to three spaces, consequently the content starts with four spaces. In the latter the indent was fixed by the content itself to seven spaces, thus it does not start with a space.

Images

reST supports an image directive (ref¹³⁸), used like so:

```
.. image:: gnu.png
(options)
```

When used within Sphinx, the file name given (here gnu.png) must either be relative to the source file, or absolute which means that they are relative to the top source directory. For example, the file sketch/spam.rst could refer to the image images/spam.png as ../images/spam.png or /images/spam.png.

Sphinx will automatically copy image files over to a subdirectory of the output directory on building (e.g. the $_$ static directory for HTML output.)

Interpretation of image size options (width and height) is as follows: if the size has no unit or the unit is pixels, the given size will only be respected for output channels that support pixels. Other units (like pt for points) will be used for HTML and LaTeX output (the latter replaces pt by bp as this is the TeX unit such that 72bp=1in).

Sphinx extends the standard docutils behavior by allowing an asterisk for the extension:

```
.. image:: gnu.*
```

Sphinx then searches for all images matching the provided pattern and determines their type. Each builder then chooses the best image out of these candidates. For instance, if the file name gnu.* was given and two files gnu.pdf and gnu.png existed in the source tree, the LaTeX builder would choose the former, while the HTML builder would prefer the latter. Supported image types and choosing priority are defined at *Builders*.

¹³⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#image

Note that image file names should not contain spaces.

Changed in version 0.4: Added the support for file names ending in an asterisk.

Changed in version 0.6: Image paths can now be absolute.

Changed in version 1.5: latex target supports pixels (default is 96px=1in).

Footnotes

For footnotes (ref¹³⁹), use [#name]_ to mark the footnote location, and add the footnote body at the bottom of the document after a "Footnotes" rubric heading, like so:

```
Lorem ipsum [#f1]_ dolor sit amet ... [#f2]_
.. rubric:: Footnotes
.. [#f1] Text of the first footnote.
.. [#f2] Text of the second footnote.
```

You can also explicitly number the footnotes ([1]_) or use auto-numbered footnotes without names ([#]_).

Citations

Standard reST citations (ref¹⁴⁰) are supported, with the additional feature that they are "global", i.e. all citations can be referenced from all files. Use them like so:

```
Lorem ipsum [Ref]_ dolor sit amet.
.. [Ref] Book or article reference, URL or whatever.
```

Citation usage is similar to footnote usage, but with a label that is not numeric or begins with #.

Substitutions

reST supports "substitutions" (ref^{141}), which are pieces of text and/or markup referred to in the text by |name|. They are defined like footnotes with explicit markup blocks, like this:

```
.. |name| replace:: replacement *text*
```

or this:

```
.. |caution| image:: warning.png
:alt: Warning!
```

See the reST reference for substitutions¹⁴² for details.

If you want to use some substitutions for all documents, put them into rst_prolog or rst_epilog or put them into a separate file and include it into all documents you want to use them in, using the include ¹⁴³ directive. (Be sure to give

¹³⁹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#footnotes

¹⁴⁰ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#citations

¹⁴¹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#substitution-definitions

¹⁴² https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#substitution-definitions

¹⁴³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

the include file a file name extension differing from that of other source files, to avoid Sphinx finding it as a standalone document.)

Sphinx defines some default substitutions, see *Substitutions*.

Comments

Every explicit markup block which isn't a valid markup construct (like the footnotes above) is regarded as a comment (ref^{144}) . For example:

```
.. This is a comment.
```

You can indent text after a comment start to form multiline comments:

```
..
This whole indented block
is a comment.
Still in the comment.
```

HTML Metadata

The meta¹⁴⁵ directive allows specifying the HTML metadata element¹⁴⁶ of a Sphinx documentation page. For example, the directive:

```
.. meta::
:description: The Sphinx documentation builder
:keywords: Sphinx, documentation, builder
```

will generate the following HTML output:

```
<meta name="description" content="The Sphinx documentation builder">
<meta name="keywords" content="Sphinx, documentation, builder">
```

Also, Sphinx will add the keywords as specified in the meta directive to the search index. Thereby, the lang attribute of the meta element is considered. For example, the directive:

```
.. meta::
    :keywords: backup
    :keywords lang=en: pleasefindthiskey pleasefindthiskeytoo
    :keywords lang=de: bittediesenkeyfinden
```

adds the following words to the search indices of builds with different language configurations:

- pleasefindthiskey, pleasefindthiskeytoo to *English* builds;
- bittediesenkeyfinden to German builds;
- · backup to builds in all languages.

¹⁴⁴ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#comments

¹⁴⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#meta

¹⁴⁶ https://developer.mozilla.org/en-US/docs/Web/HTML/Element/meta

Source encoding

Since the easiest way to include special characters like em dashes or copyright signs in reST is to directly write them as Unicode characters, one has to specify an encoding. Sphinx assumes source files to be encoded in UTF-8 by default; you can change this with the *source_encoding* config value.

Gotchas

There are some problems one commonly runs into while authoring reST documents:

- **Separation of inline markup:** As said above, inline markup spans must be separated from the surrounding text by non-word characters, you have to use a backslash-escaped space to get around that. See the reference ¹⁴⁷ for the details.
- No nested inline markup: Something like *see :func:`foo`* is not possible.

Roles

Sphinx uses interpreted text roles to insert semantic markup into documents. They are written as :rolename:`content`.

Note: The default role (`content`) has no special meaning by default. You are free to use it for anything you like, e.g. variable names; use the *default_role* config value to set it to a known role – the *any* role to find anything or the *py:obj* role to find Python objects are very useful for this.

See *Domains* for roles added by domains.

Cross-referencing syntax

See Cross-referencing syntax.

Cross-reference roles include:

- any
- doc
- download
- envvar
- keyword
- numref
- option (and the deprecated cmdoption)
- ref
- term
- token

 $^{^{147}\} https://docutils.sourceforge.io/docs/ref/rst/restructured text.html \# substitution-definitions$

Inline code highlighting

:code:

An *inline* code example. When used directly, this role just displays the text *without* syntax highlighting, as a literal.

```
By default, inline code such as :code:`1 + 2` just displays without highlighting.
```

Displays: By default, inline code such as 1 + 2 just displays without highlighting.

Unlike the *code-block* directive, this role does not respect the default language set by the *highlight* directive.

To enable syntax highlighting, you must first use the Docutils role¹⁴⁸ directive to define a custom role associated with a specific language:

```
.. role:: python(code)
   :language: python
In Python, :python:`1 + 2` is equal to :python:`3`.
```

To display a multi-line code example, use the *code-block* directive instead.

Math

:math:

Role for inline math. Use like this:

```
Since Pythagoras, we know that :math: `a^2 + b^2 = c^2`.
```

Displays: Since Pythagoras, we know that $a^2 + b^2 = c^2$.

:eq:

Same as math:numref.

Other semantic markup

The following roles don't do anything special except formatting the text in a different style:

:abbr:

An abbreviation. If the role content contains a parenthesized explanation, it will be treated specially: it will be shown in a tool-tip in HTML, and output only once in LaTeX.

For example: :abbr:`LIFO (last-in, first-out)` displays LIFO (last-in, first-out).

New in version 0.6.

:command:

The name of an OS-level command, such as rm.

For example: rm

¹⁴⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#role

:dfn:

Mark the defining instance of a term in the text. (No index entries are generated.)

For example: binary mode

:file:

The name of a file or directory. Within the contents, you can use curly braces to indicate a "variable" part, for example:

```
... is installed in :file:`/usr/lib/python3.{x}/site-packages` ...
```

Displays: ... is installed in /usr/lib/python3.x/site-packages ...

In the built documentation, the x will be displayed differently to indicate that it is to be replaced by the Python minor version.

:guilabel:

Labels presented as part of an interactive user interface should be marked using guilabel. This includes labels from text-based interfaces such as those created using curses¹⁴⁹ or other text-based libraries. Any label used in the interface should be marked with this role, including button labels, window titles, field names, menu and menu selection names, and even values in selection lists.

Changed in version 1.0: An accelerator key for the GUI label can be included using an ampersand; this will be stripped and displayed underlined in the output (for example: :guilabel:`&Cancel` displays <u>Cancel</u>). To include a literal ampersand, double it.

:kbd:

Mark a sequence of keystrokes. What form the key sequence takes may depend on platform- or application-specific conventions. When there are no relevant conventions, the names of modifier keys should be spelled out, to improve accessibility for new users and non-native speakers. For example, an *xemacs* key sequence may be marked like :kbd:`C-x C-f`, but without reference to a specific application or platform, the same sequence should be marked as :kbd:`Control-x Control-f`, displaying C-x C-f and Control-x Control-f respectively.

:mailheader:

The name of an RFC 822-style mail header. This markup does not imply that the header is being used in an email message, but can be used to refer to any header of the same "style." This is also used for headers defined by the various MIME specifications. The header name should be entered in the same way it would normally be found in practice, with the camel-casing conventions being preferred where there is more than one common usage. For example: :mailheader: `Content-Type` displays Content-Type.

:makevar:

The name of a **make** variable.

For example: help

:manpage:

A reference to a Unix manual page including the section, e.g. :manpage: ls(1) displays ls(1). Creates a hyperlink to an external site rendering the manpage if $manpages_url$ is defined.

Changed in version 7.3: Allow specifying a target with \ll , like hyperlinks. For example, :manpage: `blah <1s(1)>` displays b1ah.

:menuselection:

Menu selections should be marked using the menuselection role. This is used to mark a complete sequence of menu selections, including selecting submenus and choosing a specific operation, or any subsequence of such a sequence. The names of individual selections should be separated by -->.

¹⁴⁹ https://docs.python.org/3/library/curses.html#module-curses

For example, to mark the selection "Start > Programs", use this markup:

```
:menuselection:`Start --> Programs`
```

Displays: $Start \rightarrow Programs$

When including a selection that includes some trailing indicator, such as the ellipsis some operating systems use to indicate that the command opens a dialog, the indicator should be omitted from the selection name.

menuselection also supports ampersand accelerators just like guilabel.

:mimetype:

The name of a MIME type, or a component of a MIME type (the major or minor portion, taken alone).

For example: text/plain

:newsgroup:

The name of a Usenet newsgroup. For example: *comp.lang.python*

Todo: Is this not part of the standard domain?

:program:

The name of an executable program. This may differ from the file name for the executable for some platforms. In particular, the .exe (or other) extension should be omitted for Windows programs.

For example: curl

:regexp:

A regular expression. Quotes should not be included.

For example: ([abc])+

:samp:

A piece of literal text, such as code. Within the contents, you can use curly braces to indicate a "variable" part, as in *file*. For example, in :samp:`print(1+{variable})`, the part variable would be emphasized: print(1+variable)

If you don't need the "variable part" indication, use the standard *code* role instead.

Changed in version 1.8: Allowed to escape curly braces with double backslash. For example, in :samp:`print(f"answer=\\{1+{variable}*2\\}")`, the part variable would be emphasized and the escaped curly braces would be displayed: print(f"answer={1+variable*2}")

There is also an *index* role to generate index entries.

The following roles generate external links:

:pep:

A reference to a Python Enhancement Proposal. This generates appropriate index entries. The text "PEP number" is generated; in the HTML output, this text is a hyperlink to an online copy of the specified PEP. You can link to a specific section by saying <code>:pep:`number#anchor`</code>.

For example: **PEP 8**¹⁵⁰

¹⁵⁰ https://peps.python.org/pep-0008/

:rfc:

A reference to an Internet Request for Comments. This generates appropriate index entries. The text "RFC number" is generated; in the HTML output, this text is a hyperlink to an online copy of the specified RFC. You can link to a specific section by saying :rfc:`number#anchor`.

For example: RFC 2324¹⁵¹

Note that there are no special roles for including hyperlinks as you can use the standard reST markup for that purpose.

Substitutions

The documentation system provides some substitutions that are defined by default. They are set in the build configuration file.

|release|

Replaced by the project release the documentation refers to. This is meant to be the full version string including alpha/beta/release candidate tags, e.g. 2.5.2b3. Set by *release*.

|version|

Replaced by the project version the documentation refers to. This is meant to consist only of the major and minor version parts, e.g. 2.5, even for version 2.5.1. Set by *version*.

|today|

Replaced by either today's date (the date on which the document is read), or the date set in the build configuration file. Normally has the format April 14, 2007. Set by today_fmt and today.

|translation progress|

Replaced by the translation progress of the document. This substitution is intended for use by document translators as a marker for the translation progress of the document.

Directives

As previously discussed, a directive is a generic block of explicit markup. While Docutils provides a number of directives, Sphinx provides many more and uses directives as one of the primary extension mechanisms.

See *Domains* for roles added by domains.

See also:

Refer to the reStructuredText Primer for an overview of the directives provided by Docutils.

Table of contents

Since reST does not have facilities to interconnect several documents, or split documents into multiple output files, Sphinx uses a custom directive to add relations between the single files the documentation is made of, as well as tables of contents. The toctree directive is the central element.

Note: Simple "inclusion" of one file in another can be done with the include ¹⁵² directive.

¹⁵¹ https://datatracker.ietf.org/doc/html/rfc2324.html

¹⁵² https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

Note: To create table of contents for current document (.rst file), use the standard reST contents directive ¹⁵³.

.. toctree::

This directive inserts a "TOC tree" at the current location, using the individual TOCs (including "sub-TOC trees") of the documents given in the directive body. Relative document names (not beginning with a slash) are relative to the document the directive occurs in, absolute names are relative to the source directory. A numeric maxdepth option may be given to indicate the depth of the tree; by default, all levels are included. 169

The representation of "TOC tree" is changed in each output format. The builders that output multiple files (ex. HTML) treat it as a collection of hyperlinks. On the other hand, the builders that output a single file (ex. LaTeX, man page, etc.) replace it with the content of the documents on the TOC tree.

Consider this example (taken from the Python docs' library reference index):

```
.. toctree::
    :maxdepth: 2

    intro
    strings
    datatypes
    numeric
    (many more documents listed here)
```

This accomplishes two things:

- Tables of contents from all those documents are inserted, with a maximum depth of two, that means one nested heading. toctree directives in those documents are also taken into account.
- Sphinx knows the relative order of the documents intro, strings and so forth, and it knows that they are children of the shown document, the library index. From this information it generates "next chapter", "previous chapter" and "parent chapter" links.

Entries

Document titles in the *toctree* will be automatically read from the title of the referenced document. If that isn't what you want, you can specify an explicit title and target using a similar syntax to reST hyperlinks (and Sphinx's *cross-referencing syntax*). This looks like:

```
intro
All about strings <strings>
datatypes
```

The second line above will link to the strings document, but will use the title "All about strings" instead of the title of the strings document.

You can also add external links, by giving an HTTP URL instead of a document name.

Section numbering

If you want to have section numbers even in HTML output, give the **toplevel** toctree a **numbered** option. For example:

¹⁵³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

```
.. toctree::
   :numbered:

foo
bar
```

Numbering then starts at the heading of foo. Sub-toctrees are automatically numbered (don't give the numbered flag to those).

Numbering up to a specific depth is also possible, by giving the depth as a numeric argument to numbered.

Additional options

You can use the caption option to provide a toctree caption and you can use the name option to provide an implicit target name that can be referenced by using *ref*:

```
.. toctree::
    :caption: Table of Contents
    :name: mastertoc
    foo
```

If you want only the titles of documents in the tree to show up, not other headings of the same level, you can use the titlesonly option:

```
.. toctree::
    :titlesonly:
    foo
    bar
```

You can use "globbing" in toctree directives, by giving the glob flag option. All entries are then matched against the list of available documents, and matches are inserted into the list alphabetically. Example:

```
.. toctree::
    :glob:
    intro*
    recipe/*
    *
```

This includes first all documents whose names start with intro, then all documents in the recipe folder, then all remaining documents (except the one containing the directive, of course.)¹⁷⁰

The special entry name self stands for the document containing the toctree directive. This is useful if you want to generate a "sitemap" from the toctree.

You can use the reversed flag option to reverse the order of the entries in the list. This can be useful when using the glob flag option to reverse the ordering of the files. Example:

```
.. toctree::
    :glob:
    :reversed:
    recipe/*
```

You can also give a "hidden" option to the directive, like this:

```
.. toctree::
    :hidden:

    doc_1
    doc_2
```

This will still notify Sphinx of the document hierarchy, but not insert links into the document at the location of the directive – this makes sense if you intend to insert these links yourself, in a different style, or in the HTML sidebar.

In cases where you want to have only one top-level toctree and hide all other lower level toctrees you can add the "includehidden" option to the top-level toctree entry:

```
.. toctree::
    :includehidden:

    doc_1
    doc_2
```

All other toctree entries can then be eliminated by the "hidden" option.

In the end, all documents in the *source directory* (or subdirectories) must occur in some toctree directive; Sphinx will emit a warning if it finds a file that is not included, because that means that this file will not be reachable through standard navigation.

Use *exclude_patterns* to explicitly exclude documents or directories from building completely. Use *the "orphan" metadata* to let a document be built, but notify Sphinx that it is not reachable via a toctree.

The "root document" (selected by $root_doc$) is the "root" of the TOC tree hierarchy. It can be used as the documentation's main page, or as a "full table of contents" if you don't give a maxdepth option.

Changed in version 0.3: Added "globbing" option.

Changed in version 0.6: Added "numbered" and "hidden" options as well as external links and support for "self" references.

Changed in version 1.0: Added "titlesonly" option.

Changed in version 1.1: Added numeric argument to "numbered".

Changed in version 1.2: Added "includehidden" option.

Changed in version 1.3: Added "caption" and "name" option.

Special names

Sphinx reserves some document names for its own use; you should not try to create documents with these names – it will cause problems.

The special document names (and pages generated for them) are:

• genindex, modindex, search

These are used for the general index, the Python module index, and the search page, respectively.

The general index is populated with entries from modules, all index-generating *object descriptions*, and from *index* directives.

¹⁶⁹ The LaTeX writer only refers the maxdepth option of first toctree directive in the document.

¹⁷⁰ A note on available globbing syntax: you can use the standard shell constructs *, ?, [...] and [!...] with the feature that these all don't match slashes. A double star ** can be used to match any sequence of characters *including* slashes.

The Python module index contains one entry per py:module directive.

The search page contains a form that uses the generated JSON search index and JavaScript to full-text search the generated documents for search words; it should work on every major browser that supports modern JavaScript.

• every name beginning with _

Though few such names are currently used by Sphinx, you should not create documents or document-containing directories with such names. (Using _ as a prefix for a custom template directory is fine.)

Warning: Be careful with unusual characters in filenames. Some formats may interpret these characters in unexpected ways:

- Do not use the colon: for HTML based formats. Links to other parts may not work.
- Do not use the plus + for the ePub format. Some resources may not be found.

Paragraph-level markup

These directives create short paragraphs and can be used inside information units as well as normal text.

.. note::

An especially important bit of information about an API that a user should be aware of when using whatever bit of API the note pertains to. The content of the directive should be written in complete sentences and include all appropriate punctuation.

Example:

```
.. note::
```

This function is not suitable for sending spam e-mails.

.. warning::

An important bit of information about an API that a user should be very aware of when using whatever bit of API the warning pertains to. The content of the directive should be written in complete sentences and include all appropriate punctuation. This differs from *note* in that it is recommended over *note* for information regarding security.

.. versionadded:: version

This directive documents the version of the project which added the described feature to the library or C API. When this applies to an entire module, it should be placed at the top of the module section before any prose.

The first argument must be given and is the version in question; you can add a second argument consisting of a *brief* explanation of the change.

Example:

```
.. versionadded:: 2.5
The *spam* parameter.
```

Note that there must be no blank line between the directive head and the explanation; this is to make these blocks visually continuous in the markup.

.. versionchanged:: version

Similar to *versionadded*, but describes when and what changed in the named feature in some way (new parameters, changed side effects, etc.).

.. deprecated:: version

Similar to *versionchanged*, but describes when the feature was deprecated. An explanation can also be given, for example to inform the reader what should be used instead. Example:

```
.. deprecated:: 3.1
Use :func:`spam` instead.
```

.. versionremoved:: version

Similar to *versionadded*, but describes when the feature was removed. An explanation may be provided to inform the reader what to use instead, or why the feature was removed. Example:

```
.. versionremoved:: 4.0

The :func:`spam` function is more flexible, and should be used instead.
```

New in version 7.3.

.. seealso::

Many sections include a list of references to module documentation or external documents. These lists are created using the *seealso* directive.

The *seealso* directive is typically placed in a section just before any subsections. For the HTML output, it is shown boxed off from the main flow of the text.

The content of the seealso directive should be a reST definition list. Example:

```
.. seealso::
    Module :py:mod:`zipfile`
        Documentation of the :py:mod:`zipfile` standard module.

`GNU tar manual, Basic Tar Format <a href="https://link">https://link</a>`_
        Documentation for tar archive files, including GNU tar extensions.
```

There's also a "short form" allowed that looks like this:

```
.. seealso:: modules :py:mod:`zipfile`, :py:mod:`tarfile`
```

New in version 0.5: The short form.

.. rubric:: title

This directive creates a paragraph heading that is not used to create a table of contents node.

Note: If the *title* of the rubric is "Footnotes" (or the selected language's equivalent), this rubric is ignored by the LaTeX writer, since it is assumed to only contain footnote definitions and therefore would create an empty heading.

.. centered::

This directive creates a centered boldfaced line of text. Use it as follows:

```
.. centered:: LICENSE AGREEMENT
```

Deprecated since version 1.1: This presentation-only directive is a legacy from older versions. Use a *rst-class* directive instead and add an appropriate style.

.. hlist::

This directive must contain a bullet list. It will transform it into a more compact list by either distributing more than one item horizontally, or reducing spacing between items, depending on the builder.

For builders that support the horizontal distribution, there is a columns option that specifies the number of columns; it defaults to 2. Example:

```
.. hlist::
    :columns: 3

* A list of
    * short items
    * that should be
    * displayed
    * horizontally
```

New in version 0.6.

Showing code examples

There are multiple ways to show syntax-highlighted literal code blocks in Sphinx:

- using reST doctest blocks;
- using reST literal blocks, optionally in combination with the highlight directive;
- using the *code-block* directive;
- and using the literalinclude directive.

Doctest blocks can only be used to show interactive Python sessions, while the remaining three can be used for other languages. Of these three, literal blocks are useful when an entire document, or at least large sections of it, use code blocks with the same syntax and which should be styled in the same manner. On the other hand, the code-block directive makes more sense when you want more fine-tuned control over the styling of each block or when you have a document containing code blocks using multiple varied syntaxes. Finally, the literalinclude directive is useful for including entire code files in your documentation.

In all cases, Syntax highlighting is provided by Pygments¹⁵⁴. When using literal blocks, this is configured using any *highlight* directives in the source file. When a highlight directive is encountered, it is used until the next highlight directive is encountered. If there is no highlight directive in the file, the global highlighting language is used. This defaults to python but can be configured using the *highlight_language* config value. The following values are supported:

- none (no highlighting)
- default (similar to python3 but with a fallback to none without warning highlighting fails; the default when highlight_language isn't set)
- guess (let Pygments guess the lexer based on contents, only works with certain well-recognizable languages)
- python
- rest
- c
- ... and any other lexer alias that Pygments supports 155

¹⁵⁴ https://pygments.org

¹⁵⁵ https://pygments.org/docs/lexers

If highlighting with the selected language fails (i.e. Pygments emits an "Error" token), the block is not highlighted in any way.

Important: The list of lexer aliases supported is tied to the Pygment version. If you want to ensure consistent highlighting, you should fix your version of Pygments.

.. highlight:: language

Example:

```
.. highlight:: c
```

This language is used until the next highlight directive is encountered. As discussed previously, *language* can be any lexer alias supported by Pygments.

options

:linenothreshold: threshold (number (optional))

Enable to generate line numbers for code blocks.

This option takes an optional number as threshold parameter. If any threshold given, the directive will produce line numbers only for the code blocks longer than N lines. If not given, line numbers will be produced for all of code blocks.

Example:

```
.. highlight:: python
:linenothreshold: 5
```

:force: (no value)

If given, minor errors on highlighting are ignored.

New in version 2.1.

- .. code-block:: [language]
 .. sourcecode:: [language]
 - Example:

```
.. code-block:: ruby

Some Ruby code.
```

The directive's alias name *sourcecode* works as well. This directive takes a language name as an argument. It can be any lexer alias supported by Pygments¹⁵⁶. If it is not given, the setting of *highlight* directive will be used. If not set, *highlight_language* will be used. To display a code example *inline* within other text, rather than as a separate block, you can use the *code* role instead.

Changed in version 2.0: The language argument becomes optional.

options

:linenos: (no value)

Enable to generate line numbers for the code block:

```
.. code-block:: ruby
:linenos:

Some more Ruby code.
```

:lineno-start: number (number)

Set the first line number of the code block. If present, linenos option is also automatically activated:

```
.. code-block:: ruby
   :lineno-start: 10

Some more Ruby code, with line numbering starting at 10.
```

New in version 1.3.

:emphasize-lines: line numbers (comma separated numbers)

Emphasize particular lines of the code block:

```
.. code-block:: python
   :emphasize-lines: 3,5

def some_function():
    interesting = False
    print('This line is highlighted.')
    print('This one is not...')
    print('...but this one is.')
```

New in version 1.1.

Changed in version 1.6.6: LaTeX supports the emphasize-lines option.

:caption: caption of code block (text)

Set a caption to the code block.

New in version 1.3.

:name: a label for hyperlink (text)

Define implicit target name that can be referenced by using *ref*. For example:

```
.. code-block:: python
    :caption: this.py
    :name: this-py

print('Explicit is better than implicit.')
```

In order to cross-reference a code-block using either the *ref* or the *numref* role, it is necessary that both **name** and **caption** be defined. The argument of **name** can then be given to *numref* to generate the cross-reference. Example:

```
See :numref:`this-py` for an example.
```

When using **ref**, it is possible to generate a cross-reference with only **name** defined, provided an explicit title is given. Example:

```
See :ref:`this code snippet <this-py>` for an example.
```

New in version 1.3.

:class: class names (a list of class names separated by spaces)

The class name of the graph.

New in version 1.4.

:dedent: number (number or no value)

Strip indentation characters from the code block. When number given, leading N characters are removed. When no argument given, leading spaces are removed via textwrap.dedent()¹⁵⁷. For example:

```
.. code-block:: ruby
   :linenos:
   :dedent: 4

    some ruby code
```

New in version 1.3.

Changed in version 3.5: Support automatic dedent.

:force: (no value)

If given, minor errors on highlighting are ignored.

New in version 2.1.

.. literalinclude:: filename

Longer displays of verbatim text may be included by storing the example text in an external file containing only plain text. The file may be included using the literalinclude directive. For example, to include the Python source file example.py, use:

```
.. literalinclude:: example.py
```

The file name is usually relative to the current file's path. However, if it is absolute (starting with /), it is relative to the top source directory.

Additional options

Like <code>code-block</code>, the directive supports the <code>linenos</code> flag option to switch on line numbers, the <code>lineno-start</code> option to select the first line number, the <code>emphasize-lines</code> option to emphasize particular lines, the name option to provide an implicit target name, the <code>dedent</code> option to strip indentation characters for the code block, and a <code>language</code> option to select a language different from the current file's standard language. In addition, it supports the <code>caption</code> option; however, this can be provided with no argument to use the filename as the caption. Example with options:

```
.. literalinclude:: example.rb
   :language: ruby
   :emphasize-lines: 12,15-18
   :linenos:
```

¹⁵⁶ https://pygments.org/docs/lexers/

¹⁵⁷ https://docs.python.org/3/library/textwrap.html#textwrap.dedent

Tabs in the input are expanded if you give a tab-width option with the desired tab width.

Include files are assumed to be encoded in the *source_encoding*. If the file has a different encoding, you can specify it with the encoding option:

```
.. literalinclude:: example.py
:encoding: latin-1
```

The directive also supports including only parts of the file. If it is a Python module, you can select a class, function or method to include using the pyobject option:

```
.. literalinclude:: example.py
:pyobject: Timer.start
```

This would only include the code lines belonging to the start() method in the Timer class within the file.

Alternately, you can specify exactly which lines to include by giving a lines option:

```
.. literalinclude:: example.py
:lines: 1,3,5-10,20-
```

This includes the lines 1, 3, 5 to 10 and lines 20 to the last line.

Another way to control which part of the file is included is to use the start-after and end-before options (or only one of them). If start-after is given as a string option, only lines that follow the first line containing that string are included. If end-before is given as a string option, only lines that precede the first lines containing that string are included. The start-at and end-at options behave in a similar way, but the lines containing the matched string are included.

start-after/start-at and end-before/end-at can have same string. start-after/start-at filter lines before the line that contains option string (start-at will keep the line). Then end-before/end-at filter lines after the line that contains option string (end-at will keep the line and end-before skip the first line).

Note: If you want to select only [second-section] of ini file like the following, you can use :start-at: [second-section] and :end-before: [third-section]:

```
[first-section]
var_in_first=true

[second-section]
var_in_second=true
[third-section]
var_in_third=true
```

Useful cases of these option is working with tag comments. :start-after: [initialize] and :end-before: [initialized] options keep lines between comments:

```
if __name__ == "__main__":
    # [initialize]
    app.start(":8000")
    # [initialized]
```

When lines have been selected in any of the ways described above, the line numbers in emphasize-lines refer to those selected lines, counted consecutively starting at 1.

When specifying particular parts of a file to display, it can be useful to display the original line numbers. This can be done using the lineno-match option, which is however allowed only when the selection consists of contiguous lines.

You can prepend and/or append a line to the included code, using the prepend and append option, respectively. This is useful e.g. for highlighting PHP code that doesn't include the <?php/?> markers.

If you want to show the diff of the code, you can specify the old file by giving a diff option:

```
.. literalinclude:: example.py
   :diff: example.py.orig
```

This shows the diff between example.py and example.py.orig with unified diff format.

A force option can ignore minor errors on highlighting.

Changed in version 0.4.3: Added the encoding option.

Changed in version 0.6: Added the pyobject, lines, start-after and end-before options, as well as support for absolute filenames.

Changed in version 1.0: Added the prepend, append, and tab-width options.

Changed in version 1.3: Added the diff, lineno-match, caption, name, and dedent options.

Changed in version 1.4: Added the class option.

Changed in version 1.5: Added the start-at, and end-at options.

Changed in version 1.6: With both start-after and lines in use, the first line as per start-after is considered to be with line number 1 for lines.

Changed in version 2.1: Added the force option.

Changed in version 3.5: Support automatic dedent.

Glossary

.. glossary::

This directive must contain a reST definition-list-like markup with terms and definitions. The definitions will then be referenceable with the *term* role. Example:

```
environment
   A structure where information about all documents under the root is
   saved, and used for cross-referencing. The environment is pickled
   after the parsing stage, so that successive runs only need to read
   and parse new and changed documents.

source directory
   The directory which, including its subdirectories, contains all
```

source files for one Sphinx project.

4.1. reStructuredText 59

¹⁷¹ There is a standard . . include directive, but it raises errors if the file is not found. This one only emits a warning.

In contrast to regular definition lists, *multiple* terms per entry are allowed, and inline markup is allowed in terms. You can link to all of the terms. For example:

```
.. glossary::

term 1
term 2
Definition of both terms.
```

(When the glossary is sorted, the first term determines the sort order.)

If you want to specify "grouping key" for general index entries, you can put a "key" as "term: key". For example:

```
.. glossary::
   term 1 : A
   term 2 : B
        Definition of both terms.
```

Note that "key" is used for grouping key as is. The "key" isn't normalized; key "A" and "a" become different groups. The whole characters in "key" is used instead of a first character; it is used for "Combining Character Sequence" and "Surrogate Pairs" grouping key.

In i18n situation, you can specify "localized term: key" even if original text only have "term" part. In this case, translated "localized term" will be categorized in "key" group.

New in version 0.6: You can now give the glossary directive a :sorted: flag that will automatically sort the entries alphabetically.

Changed in version 1.1: Now supports multiple terms and inline markup in terms.

Changed in version 1.4: Index key for glossary term should be considered experimental.

Changed in version 4.4: In internationalized documentation, the :sorted: flag sorts according to translated terms.

Meta-information markup

.. sectionauthor:: name <email>

Identifies the author of the current section. The argument should include the author's name such that it can be used for presentation and email address. The domain name portion of the address should be lower case. Example:

```
.. sectionauthor:: Guido van Rossum <guido@python.org>
```

By default, this markup isn't reflected in the output in any way (it helps keep track of contributions), but you can set the configuration value *show_authors* to True to make them produce a paragraph in the output.

.. codeauthor:: name <email>

The *codeauthor* directive, which can appear multiple times, names the authors of the described code, just like *sectionauthor* names the author(s) of a piece of documentation. It too only produces output if the *show_authors* configuration value is True.

Index-generating markup

Sphinx automatically creates index entries from all object descriptions (like functions, classes or attributes) like discussed in *Domains*.

However, there is also explicit markup available, to make the index more comprehensive and enable index entries in documents where information is not mainly contained in information units, such as the language reference.

.. index:: <entries>

This directive contains one or more index entries. Each entry consists of a type and a value, separated by a colon.

For example:

This directive contains five entries, which will be converted to entries in the generated index which link to the exact location of the index statement (or, in case of offline media, the corresponding page number).

Since index directives generate cross-reference targets at their location in the source, it makes sense to put them *before* the thing they refer to -e.g. a heading, as in the example above.

The possible entry types are:

single

Creates a single index entry. Can be made a sub-entry by separating the sub-entry text with a semicolon (this notation is also used below to describe what entries are created). Examples:

```
.. index:: single: execution single: execution; context
```

- single: execution creates an index entry labelled execution.
- single: execution; context creates an sub-entry of execution labelled context.

pair

A shortcut to create two index entries. The pair of values must be separated by a semicolon. Example:

```
.. index:: pair: loop; statement
```

This would create two index entries; loop; statement and statement; loop.

triple

A shortcut to create three index entries. All three values must be separated by a semicolon. Example:

```
.. index:: triple: module; search; path
```

This would create three index entries; module; search path, search; path, module, and path; module search.

4.1. reStructuredText 61

see

A shortcut to create an index entry that refers to another entry. Example:

```
.. index:: see: entry; other
```

This would create an index entry referring from entry to other (i.e. 'entry': See 'other').

seealso

Like see, but inserts 'see also' instead of 'see'.

module, keyword, operator, object, exception, statement, builtin

These **deprecated** shortcuts all create two index entries. For example, module: hashlib creates the entries module; hashlib and hashlib; module.

Deprecated since version 1.0: These Python-specific entry types are deprecated.

Changed in version 7.1: Removal version set to Sphinx 9.0. Using these entry types will now emit warnings with the index category.

You can mark up "main" index entries by prefixing them with an exclamation mark. The references to "main" entries are emphasized in the generated index. For example, if two pages contain

```
.. index:: Python
```

and one page contains

```
.. index:: ! Python
```

then the backlink to the latter page is emphasized among the three backlinks.

For index directives containing only "single" entries, there is a shorthand notation:

```
.. index:: BNF, grammar, syntax, notation
```

This creates four index entries.

Changed in version 1.1: Added see and seealso types, as well as marking main entries.

options

:name: a label for hyperlink (text)

Define implicit target name that can be referenced by using *ref*. For example:

```
.. index:: Python
:name: py-index
```

New in version 3.0.

:index:

While the *index* directive is a block-level markup and links to the beginning of the next paragraph, there is also a corresponding role that sets the link target directly where it is used.

The content of the role can be a simple phrase, which is then kept in the text and used as an index entry. It can also be a combination of text and index entry, styled like with explicit targets of cross-references. In that case, the "target" part can be a full entry as described for the directive above. For example:

```
This is a normal reST :index:`paragraph` that contains several :index:`index entries <pair: index; entry>`.
```

New in version 1.1.

Including content based on tags

.. only:: <expression>

Include the content of the directive only if the *expression* is true. The expression should consist of tags, like this:

```
.. only:: html and draft
```

Undefined tags are false, defined tags (via the -t command-line option or within conf.py, see *here*) are true. Boolean expressions, also using parentheses (like (latex or html) and draft) are supported.

The *format* and the *name* of the current builder (html, latex or text) are always set as a tag¹⁷². To make the distinction between format and name explicit, they are also added with the prefix format_ and builder_, e.g. the epub builder defines the tags html, epub, format_html and builder_epub.

These standard tags are set after the configuration file is read, so they are not available there.

All tags must follow the standard Python identifier syntax as set out in the Identifiers and keywords¹⁵⁸ documentation. That is, a tag expression may only consist of tags that conform to the syntax of Python variables. In ASCII, this consists of the uppercase and lowercase letters A through Z, the underscore _ and, except for the first character, the digits 0 through 9.

New in version 0.6.

Changed in version 1.2: Added the name of the builder and the prefixes.

Warning: This directive is designed to control only content of document. It could not control sections, labels and so on.

Tables

Use reStructuredText tables, i.e. either

- grid table syntax (ref¹⁵⁹),
- simple table syntax (ref¹⁶⁰),
- csv-table¹⁶¹ syntax,
- or list-table 162 syntax.

The table 163 directive serves as optional wrapper of the *grid* and *simple* syntaxes.

They work fine in HTML output, but rendering tables to LaTeX is complex. Check the <code>latex_table_style</code>.

Changed in version 1.6: Merged cells (multi-row, multi-column, both) from grid tables containing complex contents such as multiple paragraphs, blockquotes, lists, literal blocks, will render correctly to LaTeX output.

4.1. reStructuredText 63

¹⁷² For most builders name and format are the same. At the moment only builders derived from the html builder distinguish between the builder format and the builder name.

Note that the current builder tag is not available in conf.py, it is only available after the builder is initialized.

¹⁵⁸ https://docs.python.org/3/reference/lexical_analysis.html#identifiers

¹⁵⁹ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#grid-tables

¹⁶⁰ https://docutils.sourceforge.io/docs/ref/rst/restructuredtext.html#simple-tables

¹⁶¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#csv-table

¹⁶² https://docutils.sourceforge.io/docs/ref/rst/directives.html#list-table

¹⁶³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table

.. tabularcolumns:: column spec

This directive influences only the LaTeX output for the next table in source. The mandatory argument is a column specification (known as an "alignment preamble" in LaTeX idiom). Please refer to a LaTeX documentation, such as the wiki page ¹⁶⁴, for basics of such a column specification.

New in version 0.3.

Note: *tabularcolumns* conflicts with :widths: option of table directives. If both are specified, :widths: option will be ignored.

Sphinx will render tables with more than 30 rows with longtable. Besides the 1, r, c and p{width} column specifiers, one can also use $X\{a\}\{b\}$ (new in version 1.5) which configures the column width to be a fraction a/b of the total line width and $Y\{f\}$ (new in version 1.6) where f is a decimal: for example $Y\{0.2\}$ means that the column will occupy 0.2 times the line width.

When this directive is used for a table with at most 30 rows, Sphinx will render it with tabulary. One can then use specific column types L (left), R (right), C (centered) and J (justified). They have the effect of a p{width} (i.e. each cell is a LaTeX \parbox) with the specified internal text alignment and an automatically computed width.

Warning:

- Cells that contain list-like elements such as object descriptions, blockquotes or any kind of lists are not compatible with the LRCJ column types. The column type must then be some $p\{\text{width}\}$ with an explicit width (or $X\{a\}\{b\}$ or $Y\{f\}$).
- Literal blocks do not work with tabulary at all. Sphinx will fall back to tabular or longtable environments and generate a suitable column specification.

In absence of the *tabularcolumns* directive, and for a table with at most 30 rows and no problematic cells as described in the above warning, Sphinx uses *tabulary* and the J column-type for every column.

Changed in version 1.6: Formerly, the L column-type was used (text is flushed-left). To revert to this, include $\$ newcolumntype{T}{L} in the LaTeX preamble, as in fact Sphinx uses T and sets it by default to be an alias of J.

Hint: A frequent issue with tabulary is that columns with little contents appear to be "squeezed". One can add to the LaTeX preamble for example \setlength{\tymin}{40pt} to ensure a minimal column width of 40pt, the tabulary default of 10pt being too small.

Hint: To force usage of the LaTeX longtable environment pass longtable as a :class: option to table ¹⁶⁵, csv-table ¹⁶⁶, or list-table ¹⁶⁷. Use *rst-class* for other tables.

Math

The input language for mathematics is LaTeX markup. This is the de-facto standard for plain-text math notation and has the added advantage that no further translation is necessary when building LaTeX output.

Keep in mind that when you put math markup in **Python docstrings** read by *autodoc*, you either have to double all backslashes, or use Python raw strings (r"raw").

.. math::

Directive for displayed math (math that takes the whole line for itself).

The directive supports multiple equations, which should be separated by a blank line:

```
.. math::

(a + b)^2 = a^2 + 2ab + b^2
(a - b)^2 = a^2 - 2ab + b^2
```

In addition, each single equation is set within a split environment, which means that you can have multiple aligned lines in an equation, aligned at & and separated by \\:

```
.. math::

(a + b)^2 &= (a + b)(a + b) \\
&= a^2 + 2ab + b^2
```

For more details, look into the documentation of the AmSMath LaTeX package ¹⁶⁸.

When the math is only one line of text, it can also be given as a directive argument:

```
.. math:: (a + b)^2 = a^2 + 2ab + b^2
```

Normally, equations are not numbered. If you want your equation to get a number, use the label option. When given, it selects an internal label for the equation, by which it can be cross-referenced, and causes an equation number to be issued. See *eq* for an example. The numbering style depends on the output format.

There is also an option nowrap that prevents any wrapping of the given math in a math environment. When you give this option, you must make sure yourself that the math is properly set up. For example:

```
.. math::
   :nowrap:

   \begin{eqnarray}
        y & = & ax^2 + bx + c \\
        f(x) & = & x^2 + 2xy + y^2
   \end{eqnarray}
```

Rendering options for math with HTML builders.

latex_engine

Explains how to configure LaTeX builder to support Unicode literals in math mark-up.

4.1. reStructuredText 65

¹⁶⁸ https://www.ams.org/publications/authors/tex/amslatex

Grammar production displays

Special markup is available for displaying the productions of a formal grammar. The markup is simple and does not attempt to model all aspects of BNF (or any derived forms), but provides enough to allow context-free grammars to be displayed in a way that causes uses of a symbol to be rendered as hyperlinks to the definition of the symbol. There is this directive:

.. productionlist:: [productionGroup]

This directive is used to enclose a group of productions. Each production is given on a single line and consists of a name, separated by a colon from the following definition. If the definition spans multiple lines, each continuation line must begin with a colon placed at the same column as in the first line. Blank lines are not allowed within productionlist directive arguments.

The definition can contain token names which are marked as interpreted text (e.g., "sum ::= `integer` "+" `integer`") – this generates cross-references to the productions of these tokens. Outside of the production list, you can reference to token productions using *token*.

The *productionGroup* argument to *productionlist* serves to distinguish different sets of production lists that belong to different grammars. Multiple production lists with the same *productionGroup* thus define rules in the same scope.

Inside of the production list, tokens implicitly refer to productions from the current group. You can refer to the production of another grammar by prefixing the token with its group name and a colon, e.g, "otherGroup:sum". If the group of the token should not be shown in the production, it can be prefixed by a tilde, e.g., "otherGroup:sum". To refer to a production from an unnamed grammar, the token should be prefixed by a colon, e.g., ":sum".

Outside of the production list, if you have given a *productionGroup* argument you must prefix the token name in the cross-reference with the group name and a colon, e.g., "myGroup:sum" instead of just "sum". If the group should not be shown in the title of the link either an explicit title can be given (e.g., "myTitle <myGroup:sum>"), or the target can be prefixed with a tilde (e.g., "~myGroup:sum").

Note that no further reST parsing is done in the production, so that you don't have to escape * or | characters.

The following is an example taken from the Python Reference Manual:

Field Lists

As previously discussed, field lists are sequences of fields marked up like this:

```
:fieldname: Field content
```

Sphinx extends standard docutils behavior for field lists and adds some extra functionality that is covered in this section.

Note: The values of field lists will be parsed as strings. You cannot use Python collections such as lists or dictionaries.

File-wide metadata

A field list near the top of a file is normally parsed by docutils as the *docinfo* and shown on the page. However, in Sphinx, a field list preceding any other markup is moved from the *docinfo* to the Sphinx environment as document metadata, and is not displayed in the output.

Note: A field list appearing after the document title *will* be part of the *docinfo* as normal and will be displayed in the output.

Special metadata fields

Sphinx provides custom behavior for bibliographic fields compared to docutils.

At the moment, these metadata fields are recognized:

tocdepth

The maximum depth for a table of contents of this file.

```
:tocdepth: 2
```

Note: This metadata effects to the depth of local toctree. But it does not effect to the depth of *global* toctree. So this would not be change the sidebar of some themes which uses global one.

New in version 0.4.

nocomments

If set, the web application won't display a comment form for a page generated from this source file.

```
:nocomments:
```

orphan

If set, warnings about this file not being included in any toctree will be suppressed.

```
:orphan:
```

New in version 1.0.

nosearch

If set, full text search for this file is disabled.

:nosearch:

Note: object search is still available even if nosearch option is set.

New in version 3.0.

4.2 Markdown

Markdown¹⁷³ is a lightweight markup language with a simplistic plain text formatting syntax. It exists in many syntactically different *flavors*. To support Markdown-based documentation, Sphinx can use MyST-Parser¹⁷⁴. MyST-Parser is a Docutils bridge to markdown-it-py¹⁷⁵, a Python package for parsing the CommonMark¹⁷⁶ Markdown flavor.

¹⁷³ https://daringfireball.net/projects/markdown/

¹⁷⁴ https://myst-parser.readthedocs.io/en/latest/

¹⁷⁵ https://github.com/executablebooks/markdown-it-py

¹⁷⁶ https://commonmark.org/

Configuration

To configure your Sphinx project for Markdown support, proceed as follows:

1. Install the Markdown parser *MyST-Parser*:

```
pip install --upgrade myst-parser
```

2. Add *myst_parser* to the list of configured extensions:

```
extensions = ['myst_parser']
```

Note: MyST-Parser requires Sphinx 2.1 or newer.

3. If you want to use Markdown files with extensions other than .md, adjust the *source_suffix* variable. The following example configures Sphinx to parse all files with the extensions .md and .txt as Markdown:

```
source_suffix = {
    '.rst': 'restructuredtext',
    '.txt': 'markdown',
    '.md': 'markdown',
}
```

4. You can further configure *MyST-Parser* to allow custom syntax that standard *CommonMark* doesn't support. Read more in the MyST-Parser documentation¹⁷⁷.

4.3 Cross-referencing syntax

Cross-references are generated by many semantic interpreted text roles. Basically, you only need to write <code>:role:`target`</code>, and a link will be created to the item named *target* of the type indicated by *role*. The link's text will be the same as *target*.

There are some additional facilities, however, that make cross-referencing roles more versatile:

- You may supply an explicit title and reference target, like in reST direct hyperlinks: :role:`title <target>` will refer to *target*, but the link text will be *title*.
- If you prefix the content with !, no reference/hyperlink will be created.
- If you prefix the content with ~, the link text will only be the last component of the target. For example, :py:meth:`~Queue.get` will refer to Queue.Queue.get but only display get as the link text. This does not work with all cross-reference roles, but is domain specific.

In HTML output, the link's title attribute (that is e.g. shown as a tool-tip on mouse-hover) will always be the full target name.

¹⁷⁷ https://myst-parser.readthedocs.io/en/latest/using/syntax-optional.html

Cross-referencing anything

:any:

New in version 1.3.

This convenience role tries to do its best to find a valid target for its reference text.

- First, it tries standard cross-reference targets that would be referenced by doc, ref or option.
 Custom objects added to the standard domain by extensions (see Sphinx.add_object_type()) are also searched.
- Then, it looks for objects (targets) in all loaded domains. It is up to the domains how specific a match must be. For example, in the Python domain a reference of :any: `Builder` would match the sphinx. builders.Builder class.

If none or multiple targets are found, a warning will be emitted. In the case of multiple targets, you can change "any" to a specific role.

This role is a good candidate for setting *default_role*. If you do, you can write cross-references without a lot of markup overhead. For example, in this Python function documentation:

```
.. function:: install()

This function installs a `handler` for every signal known by the
  `signal` module. See the section `about-signals` for more information.
```

there could be references to a glossary term (usually :term:`handler`), a Python module (usually :py:mod:`signal` or :mod:`signal`) and a section (usually :ref:`about-signals`).

The *any* role also works together with the *intersphinx* extension: when no local cross-reference is found, all object types of intersphinx inventories are also searched.

Cross-referencing objects

These roles are described with their respective domains:

- Python
- C
- C++
- JavaScript
- ReST

Cross-referencing arbitrary locations

:ref:

To support cross-referencing to arbitrary locations in any document, the standard reST labels are used. For this to work label names must be unique throughout the entire documentation. There are two ways in which you can refer to labels:

• If you place a label directly before a section title, you can reference to it with :ref:`label-name`. For example:

```
.. _my-reference-label:
Section to cross-reference
------
This is the text of the section.
It refers to the section itself, see :ref:`my-reference-label`.
```

The :ref: role would then generate a link to the section, with the link title being "Section to cross-reference". This works just as well when section and reference are in different source files.

Automatic labels also work with figures. For example:

```
.. _my-figure:
.. figure:: whatever
Figure caption
```

In this case, a reference :ref:`my-figure` would insert a reference to the figure with link text "Figure caption".

The same works for tables that are given an explicit caption using the table 178 directive.

• Labels that aren't placed before a section title can still be referenced, but you must give the link an explicit title, using this syntax: :ref:`Link title <label-name>`.

Note: Reference labels must start with an underscore. When referencing a label, the underscore must be omitted (see examples above).

Using *ref* is advised over standard reStructuredText links to sections (like `Section title`_) because it works across files, when section headings are changed, will raise warnings if incorrect, and works for all builders that support cross-references.

Cross-referencing documents

New in version 0.6.

There is also a way to directly link to documents:

:doc:

Link to the specified document; the document name can be specified in absolute or relative fashion. For example, if the reference :doc:`parrot` occurs in the document sketches/index, then the link refers to sketches/parrot. If the reference is :doc:`/people` or :doc:`../people`, the link refers to people.

If no explicit link text is given (like usual: :doc:`Monty Python members </people>`), the link caption will be the title of the given document.

¹⁷⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table

Referencing downloadable files

New in version 0.6.

:download:

This role lets you link to files within your source tree that are not reST documents that can be viewed, but files that can be downloaded.

When you use this role, the referenced file is automatically marked for inclusion in the output when building (obviously, for HTML output only). All downloadable files are put into a _downloads/<unique hash>/ subdirectory of the output directory; duplicate filenames are handled.

An example:

```
See :download:`this example script <../example.py>`.
```

The given filename is usually relative to the directory the current source file is contained in, but if it absolute (starting with /), it is taken as relative to the top source directory.

The example.py file will be copied to the output directory, and a suitable link generated to it.

Not to show unavailable download links, you should wrap whole paragraphs that have this role:

```
.. only:: builder_html
See :download:`this example script <../example.py>`.
```

Cross-referencing figures by figure number

New in version 1.3.

Changed in version 1.5: numref role can also refer sections. And numref allows [name] for the link text.

:numref:

Link to the specified figures, tables, code-blocks and sections; the standard reST labels are used. When you use this role, it will insert a reference to the figure with link text by its figure number like "Fig. 1.1".

If an explicit link text is given (as usual: :numref:`Image of Sphinx (Fig. %s) <my-figure>`), the link caption will serve as title of the reference. As placeholders, %s and {number} get replaced by the figure number and {name} by the figure caption. If no explicit link text is given, the numfig_format setting is used as fall-back default.

If *numfig* is False, figures are not numbered, so this role inserts not a reference but the label or the link text.

Cross-referencing other items of interest

The following roles do possibly create a cross-reference, but do not refer to objects:

:envvar:

An environment variable. Index entries are generated. Also generates a link to the matching *envvar* directive, if it exists.

:token:

The name of a grammar token (used to create links between *productionlist* directives).

:keyword:

The name of a keyword in Python. This creates a link to a reference label with that name, if it exists.

:option:

A command-line option to an executable program. This generates a link to a option directive, if it exists.

The following role creates a cross-reference to a term in a *glossary*:

:term:

Reference to a term in a glossary. A glossary is created using the glossary directive containing a definition list with terms and definitions. It does not have to be in the same file as the term markup, for example the Python docs have one global glossary in the glossary.rst file.

If you use a term that's not explained in a glossary, you'll get a warning during build.

4.4 Configuration

The *configuration directory* must contain a file named conf.py. This file (containing Python code) is called the "build configuration file" and contains (almost) all configuration needed to customize Sphinx input and output behavior.

An optional file docutils.conf¹⁷⁹ can be added to the configuration directory to adjust Docutils¹⁸⁰ configuration if not otherwise overridden or set by Sphinx.

The configuration file is executed as Python code at build time (using importlib.import_module()¹⁸¹, and with the current directory set to its containing directory), and therefore can execute arbitrarily complex code. Sphinx then reads simple names from the file's namespace as its configuration.

Important points to note:

- If not otherwise documented, values must be strings, and their default is the empty string.
- The term "fully-qualified name" refers to a string that names an importable Python object inside a module; for example, the FQN "sphinx.builders.Builder" means the Builder class in the sphinx.builders module.
- Remember that document names use / as the path separator and don't contain the file name extension.
- Since conf.py is read as a Python file, the usual rules apply for encodings and Unicode support.
- The contents of the config namespace are pickled (so that Sphinx can find out when configuration changes), so it may not contain unpickleable values delete them from the namespace with del if appropriate. Modules are removed automatically, so you don't need to del your imports after use.
- There is a special object named tags available in the config file. It can be used to query and change the tags (see *Including content based on tags*). Use tags.has('tag') to query, tags.add('tag') and tags. remove('tag') to change. Only tags set via the -t command-line option or via tags.add('tag') can be queried using tags.has('tag'). Note that the current builder tag is not available in conf.py, as it is created *after* the builder is initialized.

¹⁷⁹ https://docutils.sourceforge.io/docs/user/config.html

¹⁸⁰ https://docutils.sourceforge.io/

¹⁸¹ https://docs.python.org/3/library/importlib.html#importlib.import_module

Project information

project

The documented project's name.

author

The author name(s) of the document. The default value is 'unknown'.

copyright

A copyright statement in the style '2008, Author Name'.

Changed in version 7.1: The value may now be a sequence of copyright statements in the above form, which will be displayed each to their own line.

project_copyright

An alias of copyright.

New in version 3.5.

version

The major project version, used as the replacement for |version|. For example, for the Python documentation, this may be something like 2.6.

release

The full project version, used as the replacement for |release| and e.g. in the HTML templates. For example, for the Python documentation, this may be something like 2.6.0rc1.

If you don't need the separation provided between version and release, just set them both to the same value.

General configuration

extensions

A list of strings that are module names of *extensions*. These can be extensions coming with Sphinx (named sphinx.ext.*) or custom ones.

Note that you can extend $sys.path^{182}$ within the conf file if your extensions live in another directory – but make sure you use absolute paths. If your extension path is relative to the *configuration directory*, use os.path. abspath()¹⁸³ like so:

```
import sys, os
sys.path.append(os.path.abspath('sphinxext'))
extensions = ['extname']
```

That way, you can load an extension called extname from the subdirectory sphinxext.

The configuration file itself can be an extension; for that, you only need to provide a setup() function in it.

source_suffix

The file extensions of source files. Sphinx considers the files with this suffix as sources. The value can be a dictionary mapping file extensions to file types. For example:

¹⁸² https://docs.python.org/3/library/sys.html#sys.path

¹⁸³ https://docs.python.org/3/library/os.path.html#os.path.abspath

```
source_suffix = {
    '.rst': 'restructuredtext',
    '.txt': 'restructuredtext',
    '.md': 'markdown',
}
```

By default, Sphinx only supports 'restructuredtext' file type. You can add a new file type using source parser extensions. Please read a document of the extension to know which file type the extension supports.

The value may also be a list of file extensions: then Sphinx will consider that they all map to the 'restructuredtext' file type.

Default is {'.rst': 'restructuredtext'}.

Note: file extensions have to start with a dot (e.g. .rst).

Changed in version 1.3: Can now be a list of extensions.

Changed in version 1.8: Support file type mapping

source_encoding

The encoding of all reST source files. The recommended encoding, and the default value, is 'utf-8-sig'.

New in version 0.5: Previously, Sphinx accepted only UTF-8 encoded sources.

source_parsers

If given, a dictionary of parser classes for different source suffices. The keys are the suffix, the values can be either a class or a string giving a fully-qualified name of a parser class. The parser class can be either docutils. parsers.Parser or *sphinx.parsers.Parser*. Files with a suffix that is not in the dictionary will be parsed with the default reStructuredText parser.

For example:

```
source_parsers = {'.md': 'recommonmark.parser.CommonMarkParser'}
```

Note: Refer to Markdown for more information on using Markdown with Sphinx.

New in version 1.3.

Deprecated since version 1.8: Now Sphinx provides an API Sphinx.add_source_parser() to register a source parser. Please use it instead.

master_doc

Same as root_doc.

Changed in version 4.0: Renamed master_doc to root_doc.

root_doc

The document name of the "root" document, that is, the document that contains the root *toctree* directive. Default is 'index'.

Changed in version 2.0: The default is changed to 'index' from 'contents'.

Changed in version 4.0: Renamed root_doc from master_doc.

exclude_patterns

A list of glob-style patterns¹ that should be excluded when looking for source files. They are matched against the source file names relative to the source directory, using slashes as directory separators on all platforms.

Example patterns:

- 'library/xml.rst' ignores the library/xml.rst file
- 'library/xml' ignores the library/xml directory
- 'library/xml*' ignores all files and directories starting with library/xml
- '**/.svn' ignores all .svn directories

exclude_patterns is also consulted when looking for static files in html_static_path and html_extra_path.

New in version 1.0.

include_patterns

A list of glob-style patterns Page 76, 1 that are used to find source files. They are matched against the source file names relative to the source directory, using slashes as directory separators on all platforms. The default is **, meaning that all files are recursively included from the source directory. *exclude_patterns* has priority over *include_patterns*.

Example patterns:

- '**' all files in the source directory and subdirectories, recursively
- 'library/xml' just the library/xml directory
- 'library/xml*' all files and directories starting with library/xml
- '**/doc' all doc directories (this might be useful if documentation is co-located with source files)

New in version 5.1.

templates_path

A list of paths that contain extra templates (or templates that overwrite builtin/theme-specific templates). Relative paths are taken as relative to the configuration directory.

Changed in version 1.3: As these files are not meant to be built, they are automatically added to *exclude_patterns*.

template_bridge

A string with the fully-qualified name of a callable (or simply a class) that returns an instance of *TemplateBridge*. This instance is then used to render HTML documents, and possibly the output of other builders (currently the changes builder). (Note that the template bridge must be made theme-aware if HTML themes are to be used.)

rst_epilog

A string of reStructuredText that will be included at the end of every source file that is read. This is a possible place to add substitutions that should be available in every file (another being *rst_prolog*). An example:

```
rst_epilog = """
.. |psf| replace:: Python Software Foundation
"""
```

New in version 0.6.

¹ A note on available globbing syntax: you can use the standard shell constructs *, ?, [...] and [!...] with the feature that these all don't match slashes. A double star ** can be used to match any sequence of characters *including* slashes.

rst_prolog

A string of reStructuredText that will be included at the beginning of every source file that is read. This is a possible place to add substitutions that should be available in every file (another being rst_epilog). An example:

```
rst_prolog = """
.. |psf| replace:: Python Software Foundation
"""
```

New in version 1.0.

primary_domain

The name of the default *domain*. Can also be None to disable a default domain. The default is 'py'. Those objects in other domains (whether the domain name is given explicitly, or selected by a *default-domain* directive) will have the domain name explicitly prepended when named (e.g., when the default domain is C, Python functions will be named "Python function", not just "function").

New in version 1.0.

default_role

The name of a reST role (builtin or Sphinx extension) to use as the default role, that is, for text marked up `like this`. This can be set to 'py:obj' to make `filter` a cross-reference to the Python function "filter". The default is None, which doesn't reassign the default role.

The default role can always be set within individual documents using the standard reST default-role¹⁸⁴ directive.

New in version 0.4.

keep_warnings

If true, keep warnings as "system message" paragraphs in the built documents. Regardless of this setting, warnings are always written to the standard error stream when sphinx-build is run.

The default is False, the pre-0.5 behavior was to always keep them.

New in version 0.5.

suppress_warnings

A list of warning types to suppress arbitrary warning messages.

Sphinx supports following warning types:

- app.add_node
- app.add_directive
- app.add_role
- app.add_generic_role
- app.add_source_parser
- autosectionlabel.*
- download.not_readable
- epub.unknown_project_files
- epub.duplicated_toc_entry
- i18n.inconsistent_references
- index

https://docutils.sourceforge.io/docs/ref/rst/directives.html#default-role

- image.not_readable
- ref.term
- ref.ref
- ref.numref
- ref.keyword
- ref.option
- ref.citation
- ref.footnote
- ref.doc
- ref.python
- misc.highlighting_failure
- toc.circular
- toc.excluded
- toc.not_readable
- toc.secnum

You can choose from these types. You can also give only the first component to exclude all warnings attached to it.

Now, this option should be considered *experimental*.

New in version 1.4.

Changed in version 1.5: Added misc.highlighting_failure

Changed in version 1.5.1: Added epub.unknown_project_files

Changed in version 1.6: Added ref.footnote

Changed in version 2.1: Added autosectionlabel.*

Changed in version 3.3.0: Added epub.duplicated_toc_entry

Changed in version 4.3: Added toc.excluded and toc.not_readable

New in version 4.5:

Added i18n.inconsistent_references

New in version 7.1: Added index warning type.

needs_sphinx

If set to a major.minor version string like '1.1', Sphinx will compare it with its version and refuse to build if it is too old. Default is no requirement.

New in version 1.0.

Changed in version 1.4: also accepts micro version string

needs_extensions

This value can be a dictionary specifying version requirements for extensions in *extensions*, e.g. needs_extensions = {'sphinxcontrib.something': '1.5'}. The version strings should be in the form major.minor. Requirements do not have to be specified for all extensions, only for those you want to check.

This requires that the extension specifies its version to Sphinx (see *Sphinx Extensions API* for how to do that).

manpages_url

New in version 1.3.

A URL to cross-reference *manpage* roles. If this is defined to https://manpages.debian.org/{path}, the :manpage:`man(1)` role will link to <https://manpages.debian.org/man(1)>. The patterns available are:

- page the manual page (man)
- section the manual section (1)
- path the original manual page and section specified (man(1))

This also supports manpages specified as man. 1.

Note: This currently affects only HTML writers but could be expanded in the future.

New in version 1.7.

nitpicky

If true, Sphinx will warn about *all* references where the target cannot be found. Default is False. You can activate this mode temporarily using the -n command-line switch.

New in version 1.0.

nitpick_ignore

A set or list of (type, target) tuples (by default empty) that should be ignored when generating warnings in "nitpicky mode". Note that type should include the domain name if present. Example entries would be ('py:func', 'int') or ('envvar', 'LD_LIBRARY_PATH').

New in version 1.1.

Changed in version 6.2: Changed allowable container types to a set, list, or tuple

nitpick_ignore_regex

An extended version of *nitpick_ignore*, which instead interprets the type and target strings as regular expressions. Note, that the regular expression must match the whole string (as if the ^ and \$ markers were inserted).

For example, (r'py:.*', r'foo.*bar\.B.*') will ignore nitpicky warnings for all python entities that start with 'foo' and have 'bar.B' in them, such as ('py:const', 'foo_package.bar.BAZ_VALUE') or ('py:class', 'food.bar.Barman').

New in version 4.1.

Changed in version 6.2: Changed allowable container types to a set, list, or tuple

numfig

If true, figures, tables and code-blocks are automatically numbered if they have a caption. The *numref* role is enabled. Obeyed so far only by HTML and LaTeX builders. Default is False.

Note: The LaTeX builder always assigns numbers whether this option is enabled or not.

New in version 1.3.

numfig_format

A dictionary mapping 'figure', 'table', 'code-block' and 'section' to strings that are used for format of figure numbers. As a special character, %s will be replaced to figure number.

Default is to use 'Fig. %s' for 'figure', 'Table %s' for 'table', 'Listing %s' for 'code-block' and 'Section %s' for 'section'.

New in version 1.3.

numfig_secnum_depth

- if set to 0, figures, tables and code-blocks are continuously numbered starting at 1.
- if 1 (default) numbers will be x.1, x.2, ... with x the section number (top level sectioning; no x. if no section). This naturally applies only if section numbering has been activated via the :numbered: option of the toctree directive.
- 2 means that numbers will be x.y.1, x.y.2, ... if located in a sub-section (but still x.1, x.2, ... if located directly under a section and 1, 2, ... if not in any top level section.)
- etc...

New in version 1.3.

Changed in version 1.7: The LaTeX builder obeys this setting (if *numfig* is set to True).

smartquotes

If true, the Docutils Smart Quotes transform¹⁸⁵, originally based on SmartyPants¹⁸⁶ (limited to English) and currently applying to many languages, will be used to convert quotes and dashes to typographically correct entities. Default: True.

A docutils.conf¹⁸⁷ file located in the configuration directory (or a global ~/.docutils file) is obeyed unconditionally if it *deactivates* smart quotes via the corresponding Docutils option¹⁸⁸. But if it *activates* them, then *smartquotes* does prevail.

smartquotes_action

This string customizes the Smart Quotes transform. See the file smartquotes.py at the Docutils repository 189 for details. The default 'qDe' educates normal quote characters ", ', em- and en-Dashes ---, --, and ellipses

New in version 1.6.6.

smartquotes_excludes

This is a dict whose default is:

```
[{'languages': ['ja'], 'builders': ['man', 'text']}
```

Each entry gives a sufficient condition to ignore the *smartquotes* setting and deactivate the Smart Quotes transform. Accepted keys are as above 'builders' or 'languages'. The values are lists.

Note: Currently, in case of invocation of **make** with multiple targets, the first target name is the only one which is tested against the 'builders' entry and it decides for all. Also, a make text following make html needs

 $^{^{185}\} https://docutils.sourceforge.io/docs/user/smartquotes.html$

¹⁸⁶ https://daringfireball.net/projects/smartypants/

¹⁸⁷ https://docutils.sourceforge.io/docs/user/config.html

¹⁸⁸ https://docutils.sourceforge.io/docs/user/config.html#smart-quotes

¹⁸⁹ https://sourceforge.net/p/docutils/code/HEAD/tree/trunk/docutils/

to be issued in the form make text 0="-E" to force re-parsing of source files, as the cached ones are already transformed. On the other hand the issue does not arise with direct usage of **sphinx-build** as it caches (in its default usage) the parsed source files in per builder locations.

Hint: An alternative way to effectively deactivate (or customize) the smart quotes for a given builder, for example latex, is to use make this way:

```
make latex 0="-D smartquotes_action="
```

This can follow some make html with no problem, in contrast to the situation from the prior note.

New in version 1.6.6.

user_agent

A User-Agent of Sphinx. It is used for a header on HTTP access (ex. linkcheck, intersphinx and so on). Default is "Sphinx/X.Y.Z requests/X.Y.Z python/X.Y.Z".

New in version 2.3.

tls_verify

If true, Sphinx verifies server certifications. Default is True.

New in version 1.5.

tls_cacerts

A path to a certification file of CA or a path to directory which contains the certificates. This also allows a dictionary mapping hostname to the path to certificate file. The certificates are used to verify server certifications.

New in version 1.5.

Tip: Sphinx uses requests 190 as a HTTP library internally. Therefore, Sphinx refers a certification file on the directory pointed REQUESTS_CA_BUNDLE environment variable if tls_cacerts not set.

today

today_fmt

These values determine how to format the current date, used as the replacement for |today|.

- If you set today to a non-empty value, it is used.
- Otherwise, the current time is formatted using time.strftime()¹⁹¹ and the format given in today_fmt.

The default is now today and a today_fmt of '%b %d, %Y' (or, if translation is enabled with language, an equivalent format for the selected locale).

highlight_language

The default language to highlight source code in. The default is 'default'. It is similar to 'python3'; it is mostly a superset of 'python' but it fallbacks to 'none' without warning if failed. 'python3' and other languages will emit warning if failed.

The value should be a valid Pygments lexer name, see *Showing code examples* for more details.

New in version 0.5.

¹⁹⁰ https://requests.readthedocs.io/en/master/

¹⁹¹ https://docs.python.org/3/library/time.html#time.strftime

Changed in version 1.4: The default is now 'default'. If you prefer Python 2 only highlighting, you can set it back to 'python'.

highlight_options

A dictionary that maps language names to options for the lexer modules of Pygments. These are lexer-specific; for the options understood by each, see the Pygments documentation 192.

Example:

```
highlight_options = {
  'default': {'stripall': True},
  'php': {'startinline': True},
}
```

A single dictionary of options are also allowed. Then it is recognized as options to the lexer specified by highlight_language:

```
# configuration for the ``highlight_language``
highlight_options = {'stripall': True}
```

New in version 1.3.

Changed in version 3.5: Allow to configure highlight options for multiple languages

pygments_style

The style name to use for Pygments highlighting of source code. If not set, either the theme's default style or 'sphinx' is selected for HTML output.

Changed in version 0.3: If the value is a fully-qualified name of a custom Pygments style class, this is then used as custom style.

maximum_signature_line_length

If a signature's length in characters exceeds the number set, each parameter within the signature will be displayed on an individual logical line.

When None (the default), there is no maximum length and the entire signature will be displayed on a single logical line.

A 'logical line' is similar to a hard line break—builders or themes may choose to 'soft wrap' a single logical line, and this setting does not affect that behaviour.

Domains may provide options to suppress any hard wrapping on an individual object directive, such as seen in the C, C++, and Python domains (e.g. *py:function:single-line-parameter-list*).

New in version 7.1.

add_function_parentheses

A boolean that decides whether parentheses are appended to function and method role text (e.g. the content of :func:`input`) to signify that the name is callable. Default is True.

add_module_names

A boolean that decides whether module names are prepended to all *object* names (for object types where a "module" of some kind is defined), e.g. for *py:function* directives. Default is True.

toc_object_entries

Create table of contents entries for domain objects (e.g. functions, classes, attributes, etc.). Default is True.

¹⁹² https://pygments.org/docs/lexers

toc_object_entries_show_parents

A string that determines how domain objects (e.g. functions, classes, attributes, etc.) are displayed in their table of contents entry.

Use domain to allow the domain to determine the appropriate number of parents to show. For example, the Python domain would show Class.method() and function(), leaving out the module. level of parents. This is the default setting.

Use hide to only show the name of the element without any parents (i.e. method()).

Use all to show the fully-qualified name for the object (i.e. module.Class.method()), displaying all parents.

New in version 5.2.

show_authors

A boolean that decides whether *codeauthor* and *sectionauthor* directives produce any output in the built files.

modindex_common_prefix

A list of prefixes that are ignored for sorting the Python module index (e.g., if this is set to ['foo.'], then foo.bar is shown under B, not F). This can be handy if you document a project that consists of a single package. Works only for the HTML builder currently. Default is [].

New in version 0.6.

trim_footnote_reference_space

Trim spaces before footnote references that are necessary for the reST parser to recognize the footnote, but do not look too nice in the output.

New in version 0.6.

trim_doctest_flags

If true, doctest flags (comments looking like # doctest: FLAG, ...) at the ends of lines and <BLANKLINE> markers are removed for all code blocks showing interactive Python sessions (i.e. doctests). Default is True. See the extension *doctest* for more possibilities of including doctests.

New in version 1.0.

Changed in version 1.1: Now also removes <BLANKLINE>.

strip_signature_backslash

Default is False. When backslash stripping is enabled then every occurrence of \\ in a domain directive will be changed to \, even within string literals. This was the behaviour before version 3.0, and setting this variable to True will reinstate that behaviour.

New in version 3.0.

option_emphasise_placeholders

Default is False. When enabled, emphasise placeholders in *option* directives. To display literal braces, escape with a backslash (\{). For example, option_emphasise_placeholders=True and .. option:: -foption={TYPE} would render with TYPE emphasised.

New in version 5.1.

Options for internationalization

These options influence Sphinx's Native Language Support. See the documentation on Internationalization for details.

language

The code for the language the docs are written in. Any text automatically generated by Sphinx will be in that language. Also, Sphinx will try to substitute individual paragraphs from your documents with the translation sets obtained from <code>locale_dirs</code>. Sphinx will search language-specific figures named by <code>figure_language_filename</code> (e.g. the German version of <code>myfigure.png</code> will be <code>myfigure.de.png</code> by default setting) and substitute them for original figures. In the LaTeX builder, a suitable language will be selected as an option for the <code>Babel</code> package. Default is <code>'en'</code>.

New in version 0.5.

Changed in version 1.4: Support figure substitution

Changed in version 5.0.

Currently supported languages by Sphinx are:

- ar Arabic
- bg Bulgarian
- bn Bengali
- ca Catalan
- cak Kaqchikel
- cs Czech
- cy Welsh
- da Danish
- de German
- el Greek
- en English (default)
- eo Esperanto
- es Spanish
- et Estonian
- eu Basque
- fa Iranian
- fi Finnish
- fr French
- he Hebrew
- hi Hindi
- hi_IN Hindi (India)
- hr Croatian
- hu Hungarian
- id Indonesian

- it Italian
- ja Japanese
- ko Korean
- 1t Lithuanian
- 1v Latvian
- mk Macedonian
- nb_N0 Norwegian Bokmal
- ne Nepali
- nl Dutch
- pl Polish
- pt Portuguese
- pt_BR Brazilian Portuguese
- pt_PT European Portuguese
- ro Romanian
- ru Russian
- si Sinhala
- sk Slovak
- sl Slovenian
- sq Albanian
- sr Serbian
- sr@latin Serbian (Latin)
- sr_RS Serbian (Cyrillic)
- sv Swedish
- ta Tamil
- te Telugu
- tr Turkish
- uk_UA Ukrainian
- ur Urdu
- vi Vietnamese
- zh_CN Simplified Chinese
- zh_TW Traditional Chinese

locale_dirs

New in version 0.5.

Directories in which to search for additional message catalogs (see *language*), relative to the source directory. The directories on this path are searched by the standard gettext¹⁹³ module.

Internal messages are fetched from a text domain of sphinx; so if you add the directory ./locale to this setting, the message catalogs (compiled from .po format using msgfmt) must be in ./locale/language/LC_MESSAGES/sphinx.mo. The text domain of individual documents depends on gettext_compact.

The default is ['locales'].

Note: The -*v* option for sphinx-build command is useful to check the locale_dirs config works as expected. It emits debug messages if message catalog directory not found.

Changed in version 1.5: Use locales directory as a default value

gettext_allow_fuzzy_translations

If true, "fuzzy" messages in the message catalogs are used for translation. The default is False.

New in version 4.3.

gettext_compact

New in version 1.1.

If true, a document's text domain is its docname if it is a top-level project file and its very base directory otherwise.

If set to string, all document's text domain is this string, making all documents use single text domain.

By default, the document markup/code.rst ends up in the markup text domain. With this option set to False, it is markup/code.

Changed in version 3.3: The string value is now accepted.

gettext_uuid

If true, Sphinx generates uuid information for version tracking in message catalogs. It is used for:

- Add uid line for each msgids in .pot files.
- Calculate similarity between new msgids and previously saved old msgids. This calculation takes a long time

If you want to accelerate the calculation, you can use python-levenshtein 3rd-party package written in C by using pip install python-levenshtein.

The default is False.

New in version 1.3.

gettext_location

If true, Sphinx generates location information for messages in message catalogs.

The default is True.

New in version 1.3.

gettext_auto_build

If true, Sphinx builds mo file for each translation catalog files.

The default is True.

New in version 1.3.

gettext_additional_targets

To specify names to enable gettext extracting and translation applying for i18n additionally. You can specify below names:

 $^{^{193}\} https://docs.python.org/3/library/gettext.html\#module-gettext$

Index

index terms

Literal-block

literal blocks (:: annotation and code-block directive)

Doctest-block

doctest block

Raw

raw content

Image

image/figure uri

For example: gettext_additional_targets = ['literal-block', 'image'].

The default is [].

New in version 1.3.

Changed in version 4.0: The alt text for image is translated by default.

figure_language_filename

The filename format for language-specific figures. The default value is {root}.{language}{ext}. It will be expanded to dirname/filename.en.png from .. image:: dirname/filename.png. The available format tokens are:

- {root} the filename, including any path component, without the file extension, e.g. dirname/filename
- {path} the directory path component of the filename, with a trailing slash if non-empty, e.g. dirname/
- {docpath} the directory path component for the current document, with a trailing slash if non-empty.
- {basename} the filename without the directory path or file extension components, e.g. filename
- $\{ext\}$ the file extension, e.g. .png
- $\{language\}$ the translation language, e.g. en

For example, setting this to {path}{language}/{basename}{ext} will expand to dirname/en/filename. png instead.

New in version 1.4.

Changed in version 1.5: Added {path} and {basename} tokens.

Changed in version 3.2: Added {docpath} token.

translation_progress_classes

Control which, if any, classes are added to indicate translation progress. This setting would likely only be used by translators of documentation, in order to quickly indicate translated and untranslated content.

- True: add translated and untranslated classes to all nodes with translatable content.
- translated: only add the translated class.
- untranslated: only add the untranslated class.
- False: do not add any classes to indicate translation progress.

Defaults to False.

New in version 7.1.

Options for Math

These options influence Math notations.

math_number_all

Set this option to True if you want all displayed math to be numbered. The default is False.

math_eqref_format

A string used for formatting the labels of references to equations. The {number} place-holder stands for the equation number.

Example: 'Eq. {number}' gets rendered as, for example, Eq. 10.

math_numfig

If True, displayed math equations are numbered across pages when *numfig* is enabled. The *numfig_secnum_depth* setting is respected. The *eq*, not *numref*, role must be used to reference equation numbers. Default is True.

New in version 1.7.

Options for HTML output

These options influence HTML as well as HTML Help output, and other builders that use Sphinx's HTMLWriter class.

html_theme

The "theme" that the HTML output should use. See the section about theming. The default is 'alabaster'.

New in version 0.6.

html_theme_options

A dictionary of options that influence the look and feel of the selected theme. These are theme-specific. For the options understood by the builtin themes, see *this section*.

New in version 0.6.

html_theme_path

A list of paths that contain custom themes, either as subdirectories or as zip files. Relative paths are taken as relative to the configuration directory.

New in version 0.6.

html_style

html_title

The "title" for HTML documentation generated with Sphinx's own templates. This is appended to the <title> tag of individual pages, and used in the navigation bar as the "topmost" element. It defaults to 'revision> documentation'.

html short title

New in version 0.4.

html_baseurl

The base URL which points to the root of the HTML documentation. It is used to indicate the location of document using The Canonical Link Relation¹⁹⁴. Default: ''.

New in version 1.8.

html_codeblock_linenos_style

The style of line numbers for code-blocks.

- 'table' display line numbers using tag
- 'inline' display line numbers using tag (default)

New in version 3.2.

Changed in version 4.0: It defaults to 'inline'.

Deprecated since version 4.0.

html_context

A dictionary of values to pass into the template engine's context for all pages. Single values can also be put in this dictionary using the -A command-line option of sphinx-build.

New in version 0.5.

html_logo

If given, this must be the name of an image file (path relative to the *configuration directory*) that is the logo of the docs, or URL that points an image file for the logo. It is placed at the top of the sidebar; its width should therefore not exceed 200 pixels. Default: None.

New in version 0.4.1: The image file will be copied to the _static directory of the output HTML, but only if the file does not already exist there.

Changed in version 4.0: Also accepts the URL for the logo file.

html_favicon

If given, this must be the name of an image file (path relative to the *configuration directory*) that is the favicon of the docs, or URL that points an image file for the favicon. Modern browsers use this as the icon for tabs, windows and bookmarks. It should be a Windows-style icon file (.ico), which is 16x16 or 32x32 pixels large. Default: None.

New in version 0.4: The image file will be copied to the _static directory of the output HTML, but only if the file does not already exist there.

Changed in version 4.0: Also accepts the URL for the favicon.

html_css_files

A list of CSS files. The entry must be a *filename* string or a tuple containing the *filename* string and the *attributes* dictionary. The *filename* must be relative to the https://example.org/style.css. The *attributes* is used for attributes of link> tag. It defaults to an empty list.

Example:

As a special attribute, *priority* can be set as an integer to load the CSS file at an earlier or lazier step. For more information, refer *Sphinx.add_css_file()*.

 $^{^{194}\} https://datatracker.ietf.org/doc/html/rfc6596$

New in version 1.8.

Changed in version 3.5: Support priority attribute

html_js_files

A list of JavaScript *filename*. The entry must be a *filename* string or a tuple containing the *filename* string and the *attributes* dictionary. The *filename* must be relative to the *html_static_path*, or a full URI with scheme like https://example.org/script.js. The *attributes* is used for attributes of <script> tag. It defaults to an empty list.

Example:

As a special attribute, *priority* can be set as an integer to load the JavaScript file at an earlier or lazier step. For more information, refer $Sphinx.add_js_file()$.

New in version 1.8.

Changed in version 3.5: Support priority attribute

html_static_path

A list of paths that contain custom static files (such as style sheets or script files). Relative paths are taken as relative to the configuration directory. They are copied to the output's _static directory after the theme's static files, so a file named default.css will overwrite the theme's default.css.

As these files are not meant to be built, they are automatically excluded from source files.

Note: For security reasons, dotfiles under html_static_path will not be copied. If you would like to copy them intentionally, please add each filepath to this setting:

```
html_static_path = ['_static', '_static/.htaccess']
```

Another way to do that, you can also use html_extra_path. It allows to copy dotfiles under the directories.

Changed in version 0.4: The paths in <a href="https://

Changed in version 1.0: The entries in html_static_path can now be single files.

Changed in version 1.8: The files under html_static_path are excluded from source files.

html_extra_path

A list of paths that contain extra files not directly related to the documentation, such as robots.txt or . htaccess. Relative paths are taken as relative to the configuration directory. They are copied to the output directory. They will overwrite any existing file of the same name.

As these files are not meant to be built, they are automatically excluded from source files.

New in version 1.2.

Changed in version 1.4: The dotfiles in the extra directory will be copied to the output directory. And it refers *exclude_patterns* on copying extra files and directories, and ignores if path matches to patterns.

html_last_updated_fmt

If this is not None, a 'Last updated on:' timestamp is inserted at every page bottom, using the given strftime()¹⁹⁵ format. The empty string is equivalent to '%b %d, %Y' (or a locale-dependent equivalent).

¹⁹⁵ https://docs.python.org/3/library/time.html#time.strftime

html_use_smartypants

If true, quotes and dashes are converted to typographically correct entities. Default: True.

Deprecated since version 1.6: To disable smart quotes, use rather *smartquotes*.

html_permalinks

Add link anchors for each heading and description environment. Default: True.

New in version 3.5.

html_permalinks_icon

Text for link anchors for each heading and description environment. HTML entities and Unicode are allowed. Default: a paragraph sign; \P

New in version 3.5.

html_sidebars

Custom sidebar templates, must be a dictionary that maps document names to template names.

The keys can contain glob-style patterns¹, in which case all matching documents will get the specified sidebars. (A warning is emitted when a more than one glob-style pattern matches for any document.)

The values can be either lists or single strings.

• If a value is a list, it specifies the complete list of sidebar templates to include. If all or some of the default sidebars are to be included, they must be put into this list as well.

The default sidebars (for documents that don't match any pattern) are defined by theme itself. Builtin themes are using these templates by default: ['localtoc.html', 'relations.html', 'sourcelink.html', 'searchbox.html'].

• If a value is a single string, it specifies a custom sidebar to be added between the 'sourcelink.html' and 'searchbox.html' entries. This is for compatibility with Sphinx versions before 1.0.

Deprecated since version 1.7: a single string value for html_sidebars will be removed in 2.0

Builtin sidebar templates that can be rendered are:

- localtoc.html a fine-grained table of contents of the current document
- globaltoc.html a coarse-grained table of contents for the whole documentation set, collapsed
- relations.html two links to the previous and next documents
- sourcelink.html a link to the source of the current document, if enabled in html_show_sourcelink
- searchbox.html the "quick search" box

Example:

```
html_sidebars = {
   '**': ['globaltoc.html', 'sourcelink.html', 'searchbox.html'],
   'using/windows': ['windowssidebar.html', 'searchbox.html'],
}
```

This will render the custom template windowssidebar.html and the quick search box within the sidebar of the given document, and render the default sidebars for all other pages (except that the local TOC is replaced by the global TOC).

New in version 1.0: The ability to use globbing keys and to specify multiple sidebars.

Note that this value only has no effect if the chosen theme does not possess a sidebar, like the builtin **scrolls** and **haiku** themes.

html_additional_pages

Additional templates that should be rendered to HTML pages, must be a dictionary that maps document names to template names.

Example:

```
html_additional_pages = {
    'download': 'customdownload.html',
}
```

This will render the template customdownload.html as the page download.html.

html_domain_indices

If true, generate domain-specific indices in addition to the general index. For e.g. the Python domain, this is the global module index. Default is True.

This value can be a bool or a list of index names that should be generated. To find out the index name for a specific index, look at the HTML file name. For example, the Python module index has the name 'py-modindex'.

New in version 1.0.

html_use_index

If true, add an index to the HTML documents. Default is True.

New in version 0.4.

html_split_index

If true, the index is generated twice: once as a single page with all the entries, and once as one page per starting letter. Default is False.

New in version 0.4.

html_copy_source

If true, the reST sources are included in the HTML build as _sources/name. The default is True.

html_show_sourcelink

If true (and <a href="https://

New in version 0.6.

html_sourcelink_suffix

Suffix to be appended to source links (see https://html.show_sourcelink), unless they have this suffix already. Default is '.txt'.

New in version 1.5.

html_use_opensearch

If nonempty, an OpenSearch¹⁹⁶ description file will be output, and all pages will contain a <link> tag referring to it. Since OpenSearch doesn't support relative URLs for its search page location, the value of this option must be the base URL from which these documents are served (without trailing slash), e.g. "https://docs.python.org". The default is ''.

html_file_suffix

This is the file name suffix for generated HTML files, if set to a str¹⁹⁷ value. If left to the default None, the suffix will be ".html".

New in version 0.4.

¹⁹⁶ https://github.com/dewitt/opensearch

¹⁹⁷ https://docs.python.org/3/library/stdtypes.html#str

html_link_suffix

Suffix for generated links to HTML files. The default is whatever <code>html_file_suffix</code> is set to; it can be set differently (e.g. to support different web server setups).

New in version 0.6.

html_show_copyright

If true, "(C) Copyright ..." is shown in the HTML footer. Default is True.

New in version 1.0.

html_show_search_summary

If true, the text around the keyword is shown as summary of each search result. Default is True.

New in version 4.5.

html_show_sphinx

If true, "Created using Sphinx" is shown in the HTML footer. Default is True.

New in version 0.4.

html_output_encoding

Encoding of HTML output files. Default is 'utf-8'. Note that this encoding name must both be a valid Python encoding name and a valid HTML charset value.

New in version 1.0.

html_compact_lists

If true, a list all whose items consist of a single paragraph and/or a sub-list all whose items etc... (recursive definition) will not use the element for any of its items. This is standard docutils behavior. Default: True.

New in version 1.0.

html_secnumber_suffix

Suffix for section numbers. Default: ". ". Set to " " to suppress the final dot on section numbers.

New in version 1.0.

html_search_language

Language to be used for generating the HTML full-text search index. This defaults to the global language selected with *language*. If there is no support for this language, "en" is used which selects the English language.

Support is present for these languages:

- da Danish
- nl Dutch
- en English
- fi Finnish
- fr French
- de German
- hu Hungarian
- it Italian
- ja Japanese
- no Norwegian
- pt Portuguese

- ro Romanian
- ru Russian
- es Spanish
- sv Swedish
- tr Turkish
- zh Chinese

Accelerating build speed

Each language (except Japanese) provides its own stemming algorithm. Sphinx uses a Python implementation by default. You can use a C implementation to accelerate building the index file.

- PorterStemmer¹⁹⁸ (en)
- PyStemmer¹⁹⁹ (all languages)

New in version 1.1: With support for en and ja.

Changed in version 1.3: Added additional languages.

html_search_options

A dictionary with options for the search language support, empty by default. The meaning of these options depends on the language selected.

The English support has no options.

The Japanese support has these options:

Type

type is dotted module path string to specify Splitter implementation which should be derived from sphinx.search.ja.BaseSplitter. If not specified or None is specified, 'sphinx.search.ja.DefaultSplitter' will be used.

You can choose from these modules:

'sphinx.search.ja.DefaultSplitter'

TinySegmenter algorithm. This is default splitter.

'sphinx.search.ja.MecabSplitter'

MeCab binding. To use this splitter, 'mecab' python binding or dynamic link library ('libmecab.so' for linux, 'libmecab.dll' for windows) is required.

'sphinx.search.ja.JanomeSplitter'

Janome binding. To use this splitter, Janome²⁰⁰ is required.

Deprecated since version 1.6: 'mecab', 'janome' and 'default' is deprecated. To keep compatibility, 'mecab', 'janome' and 'default' are also acceptable.

Other option values depend on splitter value which you choose.

Options for 'mecab':

dic_enc

dic_enc option is the encoding for the MeCab algorithm.

¹⁹⁸ https://pypi.org/project/PorterStemmer/

¹⁹⁹ https://pypi.org/project/PyStemmer/

dict

dict option is the dictionary to use for the MeCab algorithm.

lib

lib option is the library name for finding the MeCab library via ctypes if the Python binding is not installed.

For example:

```
html_search_options = {
    'type': 'mecab',
    'dic_enc': 'utf-8',
    'dict': '/path/to/mecab.dic',
    'lib': '/path/to/libmecab.so',
}
```

Options for 'janome':

user dic

user_dic option is the user dictionary file path for Janome.

user dic enc

user_dic_enc option is the encoding for the user dictionary file specified by user_dic option. Default is 'utf8'.

New in version 1.1.

Changed in version 1.4: html_search_options for Japanese is re-organized and any custom splitter can be used by *type* settings.

The Chinese support has these options:

• dict – the jieba dictionary path if want to use custom dictionary.

html_search_scorer

The name of a JavaScript file (relative to the configuration directory) that implements a search results scorer. If empty, the default will be used.

The scorer must implement the following interface, and may optionally define the score() function for more granular control.

```
const Scorer = {
    // Implement the following function to further tweak the score for each result
    score: result => {
        const [docName, title, anchor, descr, score, filename] = result

        // ... calculate a new score ...
        return score
    },

    // query matches the full name of an object
    objNameMatch: 11,
    // or matches in the last dotted part of the object name
    objPartialMatch: 6,
    // Additive scores depending on the priority of the object
    objPrio: {
        0: 15, // used to be importantResults
```

(continues on next page)

²⁰⁰ https://pypi.org/project/Janome/

```
1: 5, // used to be objectResults
2: -5, // used to be unimportantResults
},
// Used when the priority is not in the mapping.
objPrioDefault: 0,

// query found in title
title: 15,
partialTitle: 7,

// query found in terms
term: 5,
partialTerm: 2,
};
```

New in version 1.2.

html_scaled_image_link

If true, image itself links to the original image if it doesn't have 'target' option or scale related options: 'scale', 'width', 'height'. The default is True.

Document authors can disable this feature manually with giving no-scaled-link class to the image:

```
.. image:: sphinx.png
    :scale: 50%
    :class: no-scaled-link
```

New in version 1.3.

Changed in version 3.0: It is disabled for images having no-scaled-link class

html_math_renderer

The name of math_renderer extension for HTML output. The default is 'mathjax'.

New in version 1.8.

html_experimental_html5_writer

Output is processed with HTML5 writer. Default is False.

New in version 1.6.

Deprecated since version 2.0.

html4_writer

Output is processed with HTML4 writer. Default is False.

Options for Single HTML output

singlehtml_sidebars

Custom sidebar templates, must be a dictionary that maps document names to template names. And it only allows a key named 'index'. All other keys are ignored. For more information, refer to html_sidebars. By default, it is same as html_sidebars.

Options for HTML help output

htmlhelp_basename

Output file base name for HTML help builder. Default is 'pydoc'.

htmlhelp_file_suffix

This is the file name suffix for generated HTML help files. The default is ".html".

New in version 2.0.

htmlhelp_link_suffix

Suffix for generated links to HTML files. The default is ".html".

New in version 2.0.

Options for Apple Help output

New in version 1.3.

These options influence the Apple Help output. This builder derives from the HTML builder, so the HTML options also apply where appropriate.

Note: Apple Help output will only work on Mac OS X 10.6 and higher, as it requires the **hiutil** and **codesign** command line tools, neither of which are Open Source.

You can disable the use of these tools using applehelp_disable_external_tools, but the result will not be a valid help book until the indexer is run over the .lproj folders within the bundle.

applehelp_bundle_name

The basename for the Apple Help Book. Defaults to the *project* name.

applehelp_bundle_id

The bundle ID for the help book bundle.

Warning: You *must* set this value in order to generate Apple Help.

applehelp_dev_region

The development region. Defaults to 'en-us', which is Apple's recommended setting.

applehelp_bundle_version

The bundle version (as a string). Defaults to '1'.

applehelp_icon

The help bundle icon file, or None for no icon. According to Apple's documentation, this should be a 16-by-16 pixel version of the application's icon with a transparent background, saved as a PNG file.

applehelp_kb_product

The product tag for use with <code>applehelp_kb_url</code>. Defaults to 'ct>-<release>'.

applehelp_kb_url

The URL for your knowledgebase server, e.g. https://example.com/kbsearch.py? p='product'&q='query'&l='lang'. Help Viewer will replace the values 'product', 'query' and 'lang' at runtime with the contents of applehelp_kb_product, the text entered by the user in the search box and the user's system language respectively.

Defaults to None for no remote search.

applehelp_remote_url

The URL for remote content. You can place a copy of your Help Book's Resources folder at this location and Help Viewer will attempt to use it to fetch updated content.

e.g. if you set it to https://example.com/help/Foo/ and Help Viewer wants a copy of index.html for an English speaking customer, it will look at https://example.com/help/Foo/en.lproj/index.html.

Defaults to None for no remote content.

applehelp_index_anchors

If True, tell the help indexer to index anchors in the generated HTML. This can be useful for jumping to a particular topic using the AHLookupAnchor function or the openHelpAnchor:inBook: method in your code. It also allows you to use help:anchor URLs; see the Apple documentation for more information on this topic.

applehelp_min_term_length

Controls the minimum term length for the help indexer. Defaults to None, which means the default will be used.

applehelp_stopwords

Either a language specification (to use the built-in stopwords), or the path to a stopwords plist, or None if you do not want to use stopwords. The default stopwords plist can be found at /usr/share/hiutil/Stopwords. plist and contains, at time of writing, stopwords for the following languages:

| Language | Code |
|-----------|------|
| English | en |
| German | de |
| Spanish | es |
| French | fr |
| Swedish | SV |
| Hungarian | hu |
| Italian | it |

Defaults to language, or if that is not set, to 'en'.

applehelp_locale

Specifies the locale to generate help for. This is used to determine the name of the .lproj folder inside the Help Book's Resources, and is passed to the help indexer.

Defaults to language, or if that is not set, to 'en'.

applehelp_title

Specifies the help book title. Defaults to 'roject> Help'.

applehelp_codesign_identity

Specifies the identity to use for code signing, or None if code signing is not to be performed.

Defaults to the value of the environment variable CODE_SIGN_IDENTITY, which is set by Xcode for script build phases, or None if that variable is not set.

applehelp_codesign_flags

A *list* of additional arguments to pass to **codesign** when signing the help book.

Defaults to a list based on the value of the environment variable OTHER_CODE_SIGN_FLAGS, which is set by Xcode for script build phases, or the empty list if that variable is not set.

applehelp_indexer_path

The path to the **hiutil** program. Defaults to '/usr/bin/hiutil'.

applehelp_codesign_path

The path to the **codesign** program. Defaults to '/usr/bin/codesign'.

applehelp_disable_external_tools

If True, the builder will not run the indexer or the code signing tool, no matter what other settings are specified.

This is mainly useful for testing, or where you want to run the Sphinx build on a non-Mac OS X platform and then complete the final steps on OS X for some reason.

Defaults to False.

Options for epub output

These options influence the epub output. As this builder derives from the HTML builder, the HTML options also apply where appropriate. The actual values for some of the options is not really important, they just have to be entered into the Dublin Core metadata²⁰¹.

epub_basename

The basename for the epub file. It defaults to the *project* name.

epub_theme

The HTML theme for the epub output. Since the default themes are not optimized for small screen space, using the same theme for HTML and epub output is usually not wise. This defaults to 'epub', a theme designed to save visual space.

epub_theme_options

A dictionary of options that influence the look and feel of the selected theme. These are theme-specific. For the options understood by the builtin themes, see *this section*.

New in version 1.2.

epub_title

The title of the document. It defaults to the *html_title* option but can be set independently for epub creation. It defaults to the *project* option.

Changed in version 2.0: It defaults to the project option.

epub_description

The description of the document. The default value is 'unknown'.

New in version 1.4.

Changed in version 1.5: Renamed from epub3_description

epub_author

The author of the document. This is put in the Dublin Core metadata. It defaults to the *author* option.

epub_contributor

The name of a person, organization, etc. that played a secondary role in the creation of the content of an EPUB Publication. The default value is 'unknown'.

New in version 1.4.

Changed in version 1.5: Renamed from epub3_contributor

²⁰¹ https://dublincore.org/

epub_language

The language of the document. This is put in the Dublin Core metadata. The default is the *language* option or 'en' if unset.

epub_publisher

The publisher of the document. This is put in the Dublin Core metadata. You may use any sensible string, e.g. the project homepage. The defaults to the *author* option.

epub_copyright

The copyright of the document. It defaults to the *copyright* option but can be set independently for epub creation.

epub_identifier

An identifier for the document. This is put in the Dublin Core metadata. For published documents this is the ISBN number, but you can also use an alternative scheme, e.g. the project homepage. The default value is 'unknown'.

epub_scheme

The publication scheme for the <code>epub_identifier</code>. This is put in the Dublin Core metadata. For published books the scheme is 'ISBN'. If you use the project homepage, 'URL' seems reasonable. The default value is 'unknown'.

epub_uid

A unique identifier for the document. This is put in the Dublin Core metadata. You may use a XML's Name format²⁰² string. You can't use hyphen, period, numbers as a first character. The default value is 'unknown'.

epub_cover

The cover page information. This is a tuple containing the filenames of the cover image and the html template. The rendered html cover page is inserted as the first item in the spine in content.opf. If the template filename is empty, no html cover page is created. No cover at all is created if the tuple is empty. Examples:

```
epub_cover = ('_static/cover.png', 'epub-cover.html')
epub_cover = ('_static/cover.png', '')
epub_cover = ()
```

The default value is ().

New in version 1.1.

epub_css_files

A list of CSS files. The entry must be a *filename* string or a tuple containing the *filename* string and the *attributes* dictionary. For more information, see *html_css_files*.

New in version 1.8.

epub_guide

Meta data for the guide element of content.opf. This is a sequence of tuples containing the *type*, the *uri* and the *title* of the optional guide information. See the OPF documentation at https://idpf.org/epub for details. If possible, default entries for the *cover* and *toc* types are automatically inserted. However, the types can be explicitly overwritten if the default entries are not appropriate. Example:

```
epub_guide = (('cover', 'cover.html', 'Cover Page'),)
```

The default value is ().

²⁰² https://www.w3.org/TR/REC-xml/#NT-NameStartChar

epub_pre_files

Additional files that should be inserted before the text generated by Sphinx. It is a list of tuples containing the file name and the title. If the title is empty, no entry is added to toc.ncx. Example:

```
epub_pre_files = [
    ('index.html', 'Welcome'),
]
```

The default value is [].

epub_post_files

Additional files that should be inserted after the text generated by Sphinx. It is a list of tuples containing the file name and the title. This option can be used to add an appendix. If the title is empty, no entry is added to toc.ncx. The default value is [].

epub_exclude_files

A list of files that are generated/copied in the build directory but should not be included in the epub file. The default value is [].

epub_tocdepth

The depth of the table of contents in the file toc.ncx. It should be an integer greater than zero. The default value is 3. Note: A deeply nested table of contents may be difficult to navigate.

epub_tocdup

This flag determines if a toc entry is inserted again at the beginning of its nested toc listing. This allows easier navigation to the top of a chapter, but can be confusing because it mixes entries of different depth in one list. The default value is True.

epub_tocscope

This setting control the scope of the epub table of contents. The setting can have the following values:

- 'default' include all toc entries that are not hidden (default)
- 'includehidden' include all toc entries

New in version 1.2.

epub_fix_images

This flag determines if sphinx should try to fix image formats that are not supported by some epub readers. At the moment palette images with a small color table are upgraded. You need Pillow, the Python Image Library, installed to use this option. The default value is False because the automatic conversion may lose information.

New in version 1.2.

epub_max_image_width

This option specifies the maximum width of images. If it is set to a value greater than zero, images with a width larger than the given value are scaled accordingly. If it is zero, no scaling is performed. The default value is 0. You need the Python Image Library (Pillow) installed to use this option.

New in version 1.2.

epub_show_urls

Control whether to display URL addresses. This is very useful for readers that have no other means to display the linked URL. The settings can have the following values:

- 'inline' display URLs inline in parentheses (default)
- 'footnote' display URLs in footnotes
- 'no' do not display URLs

The display of inline URLs can be customized by adding CSS rules for the class link-target.

New in version 1.2.

epub_use_index

If true, add an index to the epub document. It defaults to the html_use_index option but can be set independently for epub creation.

New in version 1.2.

epub_writing_mode

It specifies writing direction. It can accept 'horizontal' (default) and 'vertical'

| epub_writing_mode | 'horizontal' | 'vertical' |
|------------------------------|--------------------------|----------------------------|
| writing-mode ²⁰³ | horizontal-tb | vertical-rl |
| page progression | left to right | right to left |
| iBook's Scroll Theme support | scroll-axis is vertical. | scroll-axis is horizontal. |

Options for LaTeX output

These options influence LaTeX output.

latex_engine

The LaTeX engine to build the docs. The setting can have the following values:

- 'pdflatex' PDFLaTeX (default)
- 'xelatex' XeLaTeX
- 'lualatex' LuaLaTeX
- 'platex' pLaTeX
- 'uplatex' upLaTeX (default if *language* is 'ja')

Note: 2.0 adds to 'pdflatex' support in Latin language document of occasional Cyrillic or Greek letters or words. This is not automatic, see the discussion of the <code>latex_elements</code> 'fontenc' key.

If your project uses Unicode characters, setting the engine to 'xelatex' or 'lualatex' and making sure to use an OpenType font with wide-enough glyph coverage is often easier than trying to make 'pdflatex' work with the extra Unicode characters. Since Sphinx 2.0 the default is the GNU FreeFont which covers well Latin, Cyrillic and Greek.

Changed in version 2.1.0: Use xelatex (and LaTeX package xeCJK) by default for Chinese documents.

Changed in version 2.2.1: Use xelatex by default for Greek documents.

Changed in version 2.3: Add uplatex support.

Changed in version 4.0: uplatex becomes the default setting of Japanese documents.

Contrarily to *MathJaX math rendering in HTML output*, LaTeX requires some extra configuration to support Unicode literals in *math*: the only comprehensive solution (as far as we know) is to use 'xelatex' or 'lualatex' *and* to add r'\usepackage{unicode-math}' (e.g. via the *latex_elements* 'preamble' key).

^{&#}x27;pdflatex''s support for Unicode characters is limited.

²⁰³ https://developer.mozilla.org/en-US/docs/Web/CSS/writing-mode

You may prefer r'\usepackage[math-style=literal] {unicode-math}' to keep a Unicode literal such as α (U+03B1) for example as is in output, rather than being rendered as α .

latex_documents

This value determines how to group the document tree into LaTeX source files. It must be a list of tuples (startdocname, targetname, title, author, theme, toctree_only), where the items are:

startdocname

String that specifies the *document name* of the LaTeX file's master document. All documents referenced by the *startdoc* document in TOC trees will be included in the LaTeX file. (If you want to use the default root document for your LaTeX build, provide your *root_doc* here.)

targetname

File name of the LaTeX file in the output directory.

title

LaTeX document title. Can be empty to use the title of the *startdoc* document. This is inserted as LaTeX markup, so special characters like a backslash or ampersand must be represented by the proper LaTeX commands if they are to be inserted literally.

author

Author for the LaTeX document. The same LaTeX markup caveat as for *title* applies. Use \\and to separate multiple authors, as in: 'John \\and Sarah' (backslashes must be Python-escaped to reach LaTeX).

theme

LaTeX theme. See latex_theme.

toctree_only

Must be True or False. If true, the *startdoc* document itself is not included in the output, only the documents referenced by it via TOC trees. With this option, you can put extra stuff in the master document that shows up in the HTML, but not the LaTeX output.

New in version 1.2: In the past including your own document class required you to prepend the document class name with the string "sphinx". This is not necessary anymore.

New in version 0.3: The 6th item toctree_only. Tuples with 5 items are still accepted.

latex_logo

If given, this must be the name of an image file (relative to the configuration directory) that is the logo of the docs. It is placed at the top of the title page. Default: None.

latex_toplevel_sectioning

This value determines the topmost sectioning unit. It should be chosen from 'part', 'chapter' or 'section'. The default is None; the topmost sectioning unit is switched by documentclass: section is used if documentclass will be howto, otherwise chapter will be used.

Note that if LaTeX uses \part command, then the numbering of sectioning units one level deep gets off-sync with HTML numbering, because LaTeX numbers continuously \chapter (or \section for howto.)

New in version 1.4.

latex_appendices

A list of document names to append as an appendix to all manuals.

latex_domain_indices

If true, generate domain-specific indices in addition to the general index. For e.g. the Python domain, this is the global module index. Default is True.

This value can be a bool or a list of index names that should be generated, like for html_domain_indices.

New in version 1.0.

latex_show_pagerefs

If true, add page references after internal references. This is very useful for printed copies of the manual. Default is False.

New in version 1.0.

latex_show_urls

Control whether to display URL addresses. This is very useful for printed copies of the manual. The setting can have the following values:

- 'no' do not display URLs (default)
- 'footnote' display URLs in footnotes
- 'inline' display URLs inline in parentheses

New in version 1.0.

Changed in version 1.1: This value is now a string; previously it was a boolean value, and a true value selected the 'inline' display. For backwards compatibility, True is still accepted.

latex_use_latex_multicolumn

The default is False: it means that Sphinx's own macros are used for merged cells from grid tables. They allow general contents (literal blocks, lists, blockquotes, ...) but may have problems if the tabular columns directive was used to inject LaTeX mark-up of the type $>\{...\}$, $<\{...\}$, $@\{...\}$ as column specification.

Setting to True means to use LaTeX's standard \multicolumn; this is incompatible with literal blocks in the horizontally merged cell, and also with multiple paragraphs in such cell if the table is rendered using tabulary.

New in version 1.6.

latex_table_style

A list of styling classes (strings). Currently supported:

- 'booktabs': no vertical lines, and only 2 or 3 horizontal lines (the latter if there is a header), using the booktabs²⁰⁴ package.
- 'borderless': no lines whatsoever.
- 'colorrows': the table rows are rendered with alternating background colours. The interface to customize them is via *dedicated keys* of *The sphinxsetup configuration setting*.

Important: With the 'colorrows' style, the \rowcolors LaTeX command becomes a no-op (this command has limitations and has never correctly supported all types of tables Sphinx produces in LaTeX). Please update your project to use instead the *latex table color configuration* keys.

Default: ['booktabs', 'colorrows']

New in version 5.3.0.

Changed in version 6.0.0: Modify default from [] to ['booktabs', 'colorrows'].

Each table can override the global style via :class: option, or .. rst-class:: for no-directive tables (cf. *Tables*). Currently recognized classes are booktabs, borderless, standard, colorrows, nocolorrows. The latter two can be combined with any of the first three. The standard class produces tables with both horizontal and vertical lines (as has been the default so far with Sphinx).

A single-row multi-column merged cell will obey the row colour, if it is set. See also TableMergeColor{Header,Odd, Even} in the *The sphinxsetup configuration setting* section.

Note:

• It is hard-coded in LaTeX that a single cell will obey the row colour even if there is a column colour set via \columncolor from a column specification (see tabularcolumns). Sphinx provides \ sphinxnorowcolor which can be used like this:

>{\columncolor{blue}\sphinxnorowcolor}

in a table column specification.

• Sphinx also provides \sphinxcolorblend which however requires the xcolor²⁰⁵ package. Here is an example:

>{\sphinxcolorblend{!95!red}}

It means that in this column, the row colours will be slightly tinted by red; refer to xcolor²⁰⁶ documentation for more on the syntax of its \blendcolors command (a \blendcolors in place of \sphinxcolorblend would modify colours of the cell *contents*, not of the cell *background colour panel...*). You can find an example of usage in the *Deprecated APIs* section of this document in PDF format.

Hint: If you want to use a special colour for the *contents* of the cells of a given column use >{\noindent\color{<color>}}, possibly in addition to the above.

- Multi-row merged cells, whether single column or multi-column currently ignore any set column, row, or cell colour.
- It is possible for a simple cell to set a custom colour via the raw²⁰⁷ directive and the \cellcolor LaTeX command used anywhere in the cell contents. This currently is without effect in a merged cell, whatever its kind.

Hint: In a document not using 'booktabs' globally, it is possible to style an individual table via the booktabs class, but it will be necessary to add r'\usepackage{booktabs}' to the LaTeX preamble.

On the other hand one can use colorrows class for individual tables with no extra package (as Sphinx since 5.3.0 always loads colortbl²⁰⁸).

latex_use_xindy

If True, the PDF build from the LaTeX files created by Sphinx will use xindy (doc²⁰⁹) rather than makeindex for preparing the index of general terms (from index usage). This means that words with UTF-8 characters will get ordered correctly for the language.

- This option is ignored if *latex_engine* is 'platex' (Japanese documents; **mendex** replaces **makeindex** then).
- The default is True for 'xelatex' or 'lualatex' as makeindex, if any indexed term starts with a non-ascii character, creates .ind files containing invalid bytes for UTF-8 encoding. With 'lualatex' this then breaks the PDF build.
- The default is False for 'pdflatex' but True is recommended for non-English documents as soon as some indexed terms use non-ascii characters from the language script.

²⁰⁴ https://ctan.org/pkg/booktabs

²⁰⁵ https://ctan.org/pkg/xcolor

²⁰⁶ https://ctan.org/pkg/xcolor

²⁰⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#raw

²⁰⁸ https://ctan.org/pkg/colortbl

Sphinx adds to **xindy** base distribution some dedicated support for using 'pdflatex' engine with Cyrillic scripts. And whether with 'pdflatex' or Unicode engines, Cyrillic documents handle correctly the indexing of Latin names, even with diacritics.

New in version 1.8.

latex_elements

New in version 0.5.

Its documentation has moved to LaTeX customization.

latex_docclass

A dictionary mapping 'howto' and 'manual' to names of real document classes that will be used as the base for the two Sphinx classes. Default is to use 'article' for 'howto' and 'report' for 'manual'.

New in version 1.0.

Changed in version 1.5: In Japanese docs (*language* is 'ja'), by default 'jreport' is used for 'howto' and 'jsbook' for 'manual'.

latex_additional_files

A list of file names, relative to the configuration directory, to copy to the build directory when building LaTeX output. This is useful to copy files that Sphinx doesn't copy automatically, e.g. if they are referenced in custom LaTeX added in latex_elements. Image files that are referenced in source files (e.g. via . . image::) are copied automatically.

You have to make sure yourself that the filenames don't collide with those of any automatically copied files.

Attention: Filenames with extension .tex will automatically be handed over to the PDF build process triggered by *sphinx-build -M* latexpdf or by **make latexpdf**. If the file was added only to be \input{} from a modified preamble, you must add a further suffix such as .txt to the filename and adjust accordingly the \input{} command added to the LaTeX document preamble.

New in version 0.6.

Changed in version 1.2: This overrides the files which is provided from Sphinx such as sphinx.sty.

latex_theme

The "theme" that the LaTeX output should use. It is a collection of settings for LaTeX output (ex. document class, top level sectioning unit and so on).

As a built-in LaTeX themes, manual and howto are bundled.

manual

A LaTeX theme for writing a manual. It imports the report document class (Japanese documents use jsbook).

howto

A LaTeX theme for writing an article. It imports the article document class (Japanese documents use jreport rather). <code>latex_appendices</code> is available only for this theme.

It defaults to 'manual'.

New in version 3.0.

latex_theme_options

A dictionary of options that influence the look and feel of the selected theme.

New in version 3.1.

²⁰⁹ https://xindy.sourceforge.net/

latex_theme_path

A list of paths that contain custom LaTeX themes as subdirectories. Relative paths are taken as relative to the configuration directory.

New in version 3.0.

Options for text output

These options influence text output.

text_newlines

Determines which end-of-line character(s) are used in text output.

- 'unix': use Unix-style line endings (\n)
- 'windows': use Windows-style line endings $(\r\n)$
- 'native': use the line ending style of the platform the documentation is built on

Default: 'unix'.

New in version 1.1.

text_sectionchars

A string of 7 characters that should be used for underlining sections. The first character is used for first-level headings, the second for second-level headings and so on.

The default is $'*=-\sim"+$ '.

New in version 1.1.

text_add_secnumbers

A boolean that decides whether section numbers are included in text output. Default is True.

New in version 1.7.

text_secnumber_suffix

Suffix for section numbers in text output. Default: ". ". Set to " " to suppress the final dot on section numbers.

New in version 1.7.

Options for manual page output

These options influence manual page output.

man_pages

This value determines how to group the document tree into manual pages. It must be a list of tuples (startdocname, name, description, authors, section), where the items are:

startdocname

String that specifies the *document name* of the manual page's master document. All documents referenced by the *startdoc* document in TOC trees will be included in the manual file. (If you want to use the default root document for your manual pages build, use your *root_doc* here.)

name

Name of the manual page. This should be a short string without spaces or special characters. It is used to determine the file name as well as the name of the manual page (in the NAME section).

description

Description of the manual page. This is used in the NAME section. Can be an empty string if you do not want to automatically generate the NAME section.

authors

A list of strings with authors, or a single string. Can be an empty string or list if you do not want to automatically generate an AUTHORS section in the manual page.

section

The manual page section. Used for the output file name as well as in the manual page header.

New in version 1.0.

man_show_urls

If true, add URL addresses after links. Default is False.

New in version 1.1.

man_make_section_directory

If true, make a section directory on build man page. Default is True.

New in version 3.3.

Changed in version 4.0: The default is changed to False from True.

Changed in version 4.0.2: The default is changed to True from False again.

Options for Texinfo output

These options influence Texinfo output.

texinfo_documents

This value determines how to group the document tree into Texinfo source files. It must be a list of tuples (startdocname, targetname, title, author, dir_entry, description, category, toctree_only), where the items are:

startdocname

String that specifies the *document name* of the the Texinfo file's master document. All documents referenced by the *startdoc* document in TOC trees will be included in the Texinfo file. (If you want to use the default master document for your Texinfo build, provide your *root_doc* here.)

targetname

File name (no extension) of the Texinfo file in the output directory.

title

Texinfo document title. Can be empty to use the title of the *startdoc* document. Inserted as Texinfo markup, so special characters like @ and {} will need to be escaped to be inserted literally.

author

Author for the Texinfo document. Inserted as Texinfo markup. Use @* to separate multiple authors, as in: 'John@*Sarah'.

dir_entry

The name that will appear in the top-level DIR menu file.

description

Descriptive text to appear in the top-level DIR menu file.

category

Specifies the section which this entry will appear in the top-level DIR menu file.

toctree_only

Must be True or False. If true, the *startdoc* document itself is not included in the output, only the documents referenced by it via TOC trees. With this option, you can put extra stuff in the master document that shows up in the HTML, but not the Texinfo output.

New in version 1.1.

texinfo_appendices

A list of document names to append as an appendix to all manuals.

New in version 1.1.

texinfo domain indices

If true, generate domain-specific indices in addition to the general index. For e.g. the Python domain, this is the global module index. Default is True.

This value can be a bool or a list of index names that should be generated, like for html_domain_indices.

New in version 1.1.

texinfo_show_urls

Control how to display URL addresses.

- 'footnote' display URLs in footnotes (default)
- 'no' do not display URLs
- 'inline' display URLs inline in parentheses

New in version 1.1.

texinfo_no_detailmenu

If true, do not generate a @detailmenu in the "Top" node's menu containing entries for each sub-node in the document. Default is False.

New in version 1.2.

texinfo_elements

A dictionary that contains Texinfo snippets that override those Sphinx usually puts into the generated .texi files.

• Keys that you may want to override include:

'paragraphindent'

Number of spaces to indent the first line of each paragraph, default 2. Specify 0 for no indentation.

'exampleindent'

Number of spaces to indent the lines for examples or literal blocks, default 4. Specify 0 for no indentation.

'preamble'

Texinfo markup inserted near the beginning of the file.

'copying'

Texinfo markup inserted within the @copying block and displayed after the title. The default value consists of a simple title page identifying the project.

• Keys that are set by other options and therefore should not be overridden are:

```
'author' 'body' 'date' 'direntry' 'filename' 'project' 'release' 'title'
```

New in version 1.1.

texinfo_cross_references

If false, do not generate inline references in a document. That makes an info file more readable with stand-alone reader (info). Default is True.

New in version 4.4.

Options for QtHelp output

These options influence qthelp output. As this builder derives from the HTML builder, the HTML options also apply where appropriate.

qthelp_basename

The basename for the qthelp file. It defaults to the *project* name.

qthelp_namespace

The namespace for the qthelp file. It defaults to org.sphinx.cproject_name.ct_name.

qthelp_theme

The HTML theme for the qthelp output. This defaults to 'nonav'.

qthelp_theme_options

A dictionary of options that influence the look and feel of the selected theme. These are theme-specific. For the options understood by the builtin themes, see *this section*.

Options for the linkcheck builder

linkcheck_ignore

A list of regular expressions that match URIs that should not be checked when doing a linkcheck build. Example:

```
linkcheck_ignore = [r'https://localhost:\d+/']
```

New in version 1.1.

linkcheck_allowed_redirects

A dictionary that maps a pattern of the source URI to a pattern of the canonical URI. The linkcheck builder treats the redirected link as "working" when:

- the link in the document matches the source URI pattern, and
- the redirect location matches the canonical URI pattern.

Example:

```
linkcheck_allowed_redirects = {
    # All HTTP redirections from the source URI to the canonical URI will be_
    treated as "working".
    r'https://sphinx-doc\.org/.*': r'https://sphinx-doc\.org/en/master/.*'
}
```

If set, linkcheck builder will emit a warning when disallowed redirection found. It's useful to detect unexpected redirects under the warn-is-error mode.

New in version 4.1.

linkcheck_request_headers

A dictionary that maps baseurls to HTTP request headers.

The key is a URL base string like "https://www.sphinx-doc.org/". To specify headers for other hosts, "*" can be used. It matches all hosts only when the URL does not match other settings.

The value is a dictionary that maps header name to its value.

Example:

```
linkcheck_request_headers = {
    "https://www.sphinx-doc.org/": {
        "Accept": "text/html",
        "Accept-Encoding": "utf-8",
    },
    "*": {
        "Accept": "text/html,application/xhtml+xml",
    }
}
```

New in version 3.1.

linkcheck_retries

The number of times the linkcheck builder will attempt to check a URL before declaring it broken. Defaults to 1 attempt.

New in version 1.4.

linkcheck_timeout

The duration, in seconds, that the linkcheck builder will wait for a response after each hyperlink request. Defaults to 30 seconds.

New in version 1.1.

linkcheck_workers

The number of worker threads to use when checking links. Default is 5 threads.

New in version 1.1.

linkcheck_anchors

If true, check the validity of #anchors in links. Since this requires downloading the whole document, it's considerably slower when enabled. Default is True.

New in version 1.2.

linkcheck_anchors_ignore

A list of regular expressions that match anchors Sphinx should skip when checking the validity of anchors in links. This allows skipping anchors that a website's JavaScript adds to control dynamic pages or when triggering an internal REST request. Default is ["^!"].

Tip: Use <code>linkcheck_anchors_ignore_for_url</code> to check a URL, but skip verifying that the anchors exist.

Note: If you want to ignore anchors of a specific page or of pages that match a specific pattern (but still check occurrences of the same page(s) that don't have anchors), use *linkcheck_ignore* instead, for example as follows:

```
linkcheck_ignore = [
   'https://www.sphinx-doc.org/en/1.7/intro.html#',
]
```

New in version 1.5.

linkcheck_anchors_ignore_for_url

A list or tuple of regular expressions matching URLs for which Sphinx should not check the validity of anchors. This allows skipping anchor checks on a per-page basis while still checking the validity of the page itself. Default is an empty tuple ().

New in version 7.1.

linkcheck_auth

Pass authentication information when doing a linkcheck build.

A list of (regex_pattern, auth_info) tuples where the items are:

regex_pattern

A regular expression that matches a URI.

auth_info

Authentication information to use for that URI. The value can be anything that is understood by the requests library (see requests Authentication²¹⁰ for details).

The linkcheck builder will use the first matching auth_info value it can find in the linkcheck_auth list, so values earlier in the list have higher priority.

Example:

```
linkcheck_auth = [
  ('https://foo\.yourcompany\.com/.+', ('johndoe', 'secret')),
   ('https://.+\.yourcompany\.com/.+', HTTPDigestAuth(...)),
]
```

New in version 2.3.

linkcheck_rate_limit_timeout

The linkcheck builder may issue a large number of requests to the same site over a short period of time. This setting controls the builder behavior when servers indicate that requests are rate-limited.

If a server indicates when to retry (using the Retry-After²¹¹ header), linkcheck always follows the server indication.

Otherwise, linkcheck waits for a minute before to retry and keeps doubling the wait time between attempts until it succeeds or exceeds the linkcheck_rate_limit_timeout. By default, the timeout is 5 minutes.

New in version 3.4.

linkcheck_exclude_documents

A list of regular expressions that match documents in which Sphinx should not check the validity of links. This can be used for permitting link decay in legacy or historical sections of the documentation.

Example:

 $^{^{210}\} https://requests.readthedocs.io/en/latest/user/authentication/\#authentication$

https://datatracker.ietf.org/doc/html/rfc7231#section-7.1.3

```
# ignore all links in documents located in a subfolder named 'legacy'
linkcheck_exclude_documents = [r'.*/legacy/.*']
```

New in version 4.4.

linkcheck allow unauthorized

When a webserver responds with an HTTP 401 (unauthorized) response, the current default behaviour of Sphinx is to treat the link as "working". To change that behaviour, set this option to False.

The default value for this option will be changed in Sphinx 8.0; from that version onwards, HTTP 401 responses to checked hyperlinks will be treated as "broken" by default.

New in version 7.3.

Options for the XML builder

xml_pretty

If true, pretty-print the XML. Default is True.

New in version 1.2.

Options for the C domain

c_id_attributes

A list of strings that the parser additionally should accept as attributes. This can for example be used when attributes have been #define d for portability.

New in version 3.0.

c_paren_attributes

A list of strings that the parser additionally should accept as attributes with one argument. That is, if my_align_as is in the list, then my_align_as(X) is parsed as an attribute for all strings X that have balanced braces ((), [], and {}). This can for example be used when attributes have been #define d for portability.

New in version 3.0.

c_extra_keywords

A list of identifiers to be recognized as keywords by the C parser. It defaults to ['alignas', 'alignof', 'bool', 'complex', 'imaginary', 'noreturn', 'static_assert', 'thread_local'].

New in version 4.0.3.

c_maximum_signature_line_length

If a signature's length in characters exceeds the number set, each parameter will be displayed on an individual logical line. This is a domain-specific setting, overriding maximum_signature_line_length.

New in version 7.1.

Options for the C++ domain

cpp_index_common_prefix

A list of prefixes that will be ignored when sorting C++ objects in the global index. For example ['awesome_lib::'].

New in version 1.5.

cpp_id_attributes

A list of strings that the parser additionally should accept as attributes. This can for example be used when attributes have been #define d for portability.

New in version 1.5.

cpp_paren_attributes

A list of strings that the parser additionally should accept as attributes with one argument. That is, if my_align_as is in the list, then my_align_as(X) is parsed as an attribute for all strings X that have balanced braces ((), [], and {}). This can for example be used when attributes have been #define d for portability.

New in version 1.5.

cpp_maximum_signature_line_length

If a signature's length in characters exceeds the number set, each parameter will be displayed on an individual logical line. This is a domain-specific setting, overriding <code>maximum_signature_line_length</code>.

New in version 7.1.

Options for the Python domain

python_display_short_literal_types

This value controls how Literal²¹² types are displayed. The setting is a boolean, default False.

Examples

The examples below use the following *py:function* directive:

```
.. py:function:: serve_food(item: Literal["egg", "spam", "lobster thermidor"]) ->_ 
→None
```

When False, Literal²¹³ types display as per standard Python syntax, i.e.:

```
serve_food(item: Literal["egg", "spam", "lobster thermidor"]) -> None
```

When True, Literal²¹⁴ types display with a short, **PEP 604**²¹⁵-inspired syntax, i.e.:

```
serve_food(item: "egg" | "spam" | "lobster thermidor") -> None
```

New in version 6.2.

²¹² https://docs.python.org/3/library/typing.html#typing.Literal

²¹³ https://docs.python.org/3/library/typing.html#typing.Literal

https://docs.python.org/3/library/typing.html#typing.Literal

²¹⁵ https://peps.python.org/pep-0604/

python_use_unqualified_type_names

If true, suppress the module name of the python reference if it can be resolved. The default is False.

New in version 4.0.

Note: This configuration is still in experimental

python_maximum_signature_line_length

If a signature's length in characters exceeds the number set, each argument or type parameter will be displayed on an individual logical line. This is a domain-specific setting, overriding maximum_signature_line_length.

For the Python domain, the signature length depends on whether the type parameters or the list of arguments are being formatted. For the former, the signature length ignores the length of the arguments list; for the latter, the signature length ignores the length of the type parameters list.

For instance, with $python_maximum_signature_line_length = 20$, only the list of type parameters will be wrapped while the arguments list will be rendered on a single line

```
.. py:function:: add[T: VERY_LONG_SUPER_TYPE, U: VERY_LONG_SUPER_TYPE](a: T, b: U)
```

New in version 7.1.

Options for the Javascript domain

javascript_maximum_signature_line_length

If a signature's length in characters exceeds the number set, each parameter will be displayed on an individual logical line. This is a domain-specific setting, overriding maximum_signature_line_length.

New in version 7.1.

Example of configuration file

```
# test documentation build configuration file, created by
# sphinx-quickstart on Sun Jun 26 00:00:43 2016.
#
# This file is executed through importlib.import_module with
# the current directory set to its containing dir.
#
# Note that not all possible configuration values are present in this
# autogenerated file.
#
# All configuration values have a default; values that are commented out
# serve to show the default.
# If extensions (or modules to document with autodoc) are in another directory,
# add these directories to sys.path here. If the directory is relative to the
# documentation root, use os.path.abspath to make it absolute, like shown here.
# import os
# import sys
# sys.path.insert(0, os.path.abspath('.'))
```

(continues on next page)

```
# -- General configuration -----
# If your documentation needs a minimal Sphinx version, state it here.
\# needs_sphinx = '1.0'
# Add any Sphinx extension module names here, as strings. They can be
# extensions coming with Sphinx (named 'sphinx.ext.*') or your custom
# ones.
extensions = []
# Add any paths that contain templates here, relative to this directory.
templates_path = ['_templates']
# The suffix(es) of source filenames.
# You can specify multiple suffix as a list of string:
# source_suffix = ['.rst', '.md']
source_suffix = '.rst'
# The encoding of source files.
# source_encoding = 'utf-8-sig'
# The master toctree document.
root_doc = 'index'
# General information about the project.
project = 'test'
copyright = '2016, test'
author = 'test'
# The version info for the project you're documenting, acts as replacement for
# |version| and |release|, also used in various other places throughout the
# built documents.
# The short X.Y version.

4.5 Builders

These are the built-in Sphinx builders. More builders can be added by *extensions*.

The builder's "name" must be given to the **-M** or **-b** command-line options of **sphinx-build** to select a builder.

The most common builders are:

html

Build HTML pages. This is the default builder.

dirhtml

Build HTML pages, but with a single directory per document. Makes for prettier URLs (no .html) if served from a webserver.

singlehtml

Build a single HTML with the whole content.

htmlhelp, qthelp, devhelp, epub

Build HTML files with additional information for building a documentation collection in one of these formats.

applehelp

Build an Apple Help Book. Requires **hiutil** and **codesign**, which are not Open Source and presently only available on Mac OS X 10.6 and higher.

latex

Build LaTeX sources that can be compiled to a PDF document using **pdflatex**.

man

Build manual pages in groff format for UNIX systems.

texinfo

Build Texinfo files that can be processed into Info files using **makeinfo**.

text

Build plain text files.

gettext

Build gettext-style message catalogs (.pot files).

doctest

Run all doctests in the documentation, if the *doctest* extension is enabled.

linkcheck

Check the integrity of all external links.

xml

Build Docutils-native XML files.

pseudoxml

Build compact pretty-printed "pseudo-XML" files displaying the internal structure of the intermediate document trees.

class sphinx.builders.html.StandaloneHTMLBuilder

This is the standard HTML builder. Its output is a directory with HTML files, complete with style sheets and optionally the reST sources. There are quite a few configuration values that customize the output of this builder, see the chapter *Options for HTML output* for details.

```
name = 'html'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>216</sup>[str<sup>217</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

class sphinx.builders.dirhtml.DirectoryHTMLBuilder

This is a subclass of the standard HTML builder. Its output is a directory with HTML files, where each file is called index.html and placed in a subdirectory named like its page name. For example, the document markup/rest.rst will not result in an output file markup/rest.html, but markup/rest/index.html. When generating links between pages, the index.html is omitted, so that the URL would look like markup/rest/.

```
name = 'dirhtml'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>218</sup>[str<sup>219</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 0.6.

class sphinx.builders.singlehtml.SingleFileHTMLBuilder

This is an HTML builder that combines the whole project in one output file. (Obviously this only works with smaller projects.) The file is named like the root document. No indices will be generated.

4.5. Builders 123

 $^{^{216}\} https://docs.python.org/3/library/stdtypes.html\#list$

²¹⁷ https://docs.python.org/3/library/stdtypes.html#str

²¹⁸ https://docs.python.org/3/library/stdtypes.html#list

²¹⁹ https://docs.python.org/3/library/stdtypes.html#str

name = 'singlehtml'

The builder's name, for the -b command line option.

format = 'html'

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>220</sup>[str<sup>221</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.0.

class sphinxcontrib.htmlhelp.HTMLHelpBuilder

This builder produces the same output as the standalone HTML builder, but also generates HTML Help support files that allow the Microsoft HTML Help Workshop to compile them into a CHM file.

name = 'htmlhelp'

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>222</sup>[str<sup>223</sup>] = ['image/png', 'image/gif', 'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

class sphinxcontrib.qthelp.QtHelpBuilder

This builder produces the same output as the standalone HTML builder, but also generates Qt help²²⁴ collection support files that allow the Qt collection generator to compile them.

Changed in version 2.0: Moved to sphinxcontrib.qthelp from sphinx.builders package.

```
name = 'qthelp'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>225</sup>[str<sup>226</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

class sphinxcontrib.applehelp.AppleHelpBuilder

This builder produces an Apple Help Book based on the same output as the standalone HTML builder.

If the source directory contains any .lproj folders, the one corresponding to the selected language will have its contents merged with the generated output. These folders will be ignored by all other documentation types.

In order to generate a valid help book, this builder requires the command line tool **hiutil**, which is only available on Mac OS X 10.6 and above. You can disable the indexing step by setting

²²⁰ https://docs.python.org/3/library/stdtypes.html#list

²²¹ https://docs.python.org/3/library/stdtypes.html#str

²²² https://docs.python.org/3/library/stdtypes.html#list

²²³ https://docs.python.org/3/library/stdtypes.html#str

²²⁴ https://doc.qt.io/qt-4.8/qthelp-framework.html

²²⁵ https://docs.python.org/3/library/stdtypes.html#list

²²⁶ https://docs.python.org/3/library/stdtypes.html#str

applehelp_disable_external_tools to True, in which case the output will not be valid until **hiutil** has been run on all of the .lproj folders within the bundle.

```
name = 'applehelp'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list^{227}[str^{228}] = ['image/png', 'image/gif', 'image/jpeg', 'image/tiff', 'image/jp2', 'image/svg+xml']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.3.

Changed in version 2.0: Moved to sphinxcontrib.applehelp from sphinx.builders package.

class sphinxcontrib.devhelp.DevhelpBuilder

This builder produces the same output as the standalone HTML builder, but also generates GNOME Devhelp²²⁹ support file that allows the GNOME Devhelp reader to view them.

```
name = 'devhelp'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>230</sup>[str<sup>231</sup>] = ['image/png', 'image/gif', 'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

Changed in version 2.0: Moved to sphinxcontrib.devhelp from sphinx.builders package.

class sphinx.builders.epub3.Epub3Builder

This builder produces the same output as the standalone HTML builder, but also generates an *epub* file for ebook readers. See *Epub info* for details about it. For definition of the epub format, have a look at https://idpf.org/epub or https://en.wikipedia.org/wiki/EPUB. The builder creates *EPUB 3* files.

```
name = 'epub'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>232</sup>[str<sup>233</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.4.

Changed in version 1.5: Since Sphinx 1.5, the epub3 builder is used as the default epub builder.

²³³ https://docs.python.org/3/library/stdtypes.html#str

class sphinx.builders.latex.LaTeXBuilder

This builder produces LaTeX source files in the output directory. The actual PDF builds happen inside this output directory and need to be triggered in a second step. This can be done via **make all-pdf** there. To combine the two steps into only one, use sphinx-build - M (i.e. -M latexpdf not -b latexpdf) or **make latexpdf** at the project root.

See latex_documents and the chapter Options for LaTeX output for available options.

PDF builds need a sufficiently complete LaTeX installation. The testing is currently (since 5.3.0) done on Ubuntu 22.04LTS, whose LaTeX distribution matches upstream TeXLive 2021 as of 2022/02/04, but PDF builds can be successfully done on much older LaTeX installations.

At any rate, on Ubuntu for example, following packages must all be present:

- texlive-latex-recommended
- texlive-fonts-recommended
- tex-gyre (if *latex_engine* left to default)
- texlive-latex-extra
- latexmk

Changed in version 4.0.0: TeX Gyre fonts now required for 'pdflatex' engine (default).

Additional packages are needed in some circumstances:

- texlive-lang-cyrillic for Cyrillic (and also then cm-super if using the default fonts),
- texlive-lang-greek for Greek (and also then cm-super if using the default fonts),
- texlive-xetex if latex_engine is 'xelatex',
- texlive-luatex if *latex_engine* is 'lualatex',
- fonts-freefont-otf if <code>latex_engine</code> is either 'xelatex' or 'lualatex'.

Note: Since 1.6, make latexpdf uses on GNU/Linux and macOS latexmk, as it makes sure the needed number of runs is automatically executed. On Windows the PDF builds execute a fix number of LaTeX runs (three, then makeindex, then two more).

One can pass to latexmk options via the LATEXMKOPTS Makefile variable. For example:

```
make latexpdf LATEXMKOPTS="-silent"
```

reduces console output to a minimum.

Also, if latexmk is at version 4.52b or higher (January 2017) LATEXMKOPTS="-xelatex" speeds up PDF builds via XeLateX in case of numerous graphics inclusions.

To pass options directly to the (pdf|xe|lua)latex binary, use variable LATEXOPTS, for example:

```
make latexpdf LATEXOPTS="--halt-on-error"
```

name = 'latex'

The builder's name, for the -b command line option.

format = 'latex'

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>234</sup>[str<sup>235</sup>] = ['application/pdf', 'image/png',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

Note that a direct PDF builder is being provided by rinohtype²³⁶. The builder's name is rinoh. Refer to the rinohtype manual²³⁷ for details.

class sphinx.builders.text.TextBuilder

This builder produces a text file for each reST file – this is almost the same as the reST source, but with much of the markup stripped for better readability.

```
name = 'text'
```

The builder's name, for the -b command line option.

```
format = 'text'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>238</sup>[str<sup>239</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 0.4.

class sphinx.builders.manpage.ManualPageBuilder

This builder produces manual pages in the groff format. You have to specify which documents are to be included in which manual pages via the *man_pages* configuration value.

```
name = 'man'
```

The builder's name, for the -b command line option.

```
format = 'man'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>240</sup>[str<sup>241</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.0.

class sphinx.builders.texinfo.TexinfoBuilder

This builder produces Texinfo files that can be processed into Info files by the **makeinfo** program. You have to specify which documents are to be included in which Texinfo files via the <code>texinfo_documents</code> configuration value.

The Info format is the basis of the on-line help system used by GNU Emacs and the terminal-based program **info**. See *Texinfo info* for more details. The Texinfo format is the official documentation system used by the GNU project. More information on Texinfo can be found at https://www.gnu.org/software/texinfo/.

name = 'texinfo'

The builder's name, for the -b command line option.

4.5. Builders 127

²⁴¹ https://docs.python.org/3/library/stdtypes.html#str

format = 'texinfo'

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>242</sup>[str<sup>243</sup>] = ['image/png', 'image/jpeg', 'image/gif']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.1.

class sphinxcontrib.serializinghtml.SerializingHTMLBuilder

This builder uses a module that implements the Python serialization API (*pickle*, *simplejson*, *phpserialize*, and others) to dump the generated HTML documentation. The pickle builder is a subclass of it.

A concrete subclass of this builder serializing to the PHP serialization²⁴⁴ format could look like this:

```
import phpserialize
class PHPSerializedBuilder(SerializingHTMLBuilder):
   name = 'phpserialized'
   implementation = phpserialize
   out_suffix = '.file.phpdump'
   globalcontext_filename = 'globalcontext.phpdump'
   searchindex_filename = 'searchindex.phpdump'
```

implementation

A module that implements dump(), load(), dumps() and loads() functions that conform to the functions with the same names from the pickle module. Known modules implementing this interface are simplejson, physerialize, plistlib, and others.

out_suffix

The suffix for all regular files.

globalcontext_filename

The filename for the file that contains the "global context". This is a dict with some general configuration values such as the name of the project.

searchindex_filename

The filename for the search index Sphinx generates.

See Serialization builder details for details about the output format.

New in version 0.5.

class sphinxcontrib.serializinghtml.PickleHTMLBuilder

This builder produces a directory with pickle files containing mostly HTML fragments and TOC information, for use of a web application (or custom postprocessing tool) that doesn't use the standard HTML templates.

See Serialization builder details for details about the output format.

```
name = 'pickle'
```

The builder's name, for the -b command line option.

The old name web still works as well.

²⁴² https://docs.python.org/3/library/stdtypes.html#list

²⁴³ https://docs.python.org/3/library/stdtypes.html#str

²⁴⁴ https://pypi.org/project/phpserialize/

format = 'html'

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>245</sup>[str<sup>246</sup>] = ['image/svg+xml', 'image/png', 'image/gif',
'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

The file suffix is .fpickle. The global context is called globalcontext.pickle, the search index searchindex.pickle.

class sphinxcontrib.serializinghtml.JSONHTMLBuilder

This builder produces a directory with JSON files containing mostly HTML fragments and TOC information, for use of a web application (or custom postprocessing tool) that doesn't use the standard HTML templates.

See Serialization builder details for details about the output format.

```
name = 'json'
```

The builder's name, for the -b command line option.

```
format = 'html'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list^{247}[str^{248}] = ['image/svg+xml', 'image/png', 'image/gif', 'image/jpeg']
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

The file suffix is .fjson. The global context is called global context.json, the search index searchindex.json.

New in version 0.5.

class sphinx.builders.gettext.MessageCatalogBuilder

This builder produces gettext-style message catalogs. Each top-level file or subdirectory grows a single .pot catalog template.

See the documentation on *Internationalization* for further reference.

```
name = 'gettext'
```

The builder's name, for the -b command line option.

```
format = ''
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list^{249}[str^{250}] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.1.

²⁵⁰ https://docs.python.org/3/library/stdtypes.html#str

class sphinx.builders.changes.ChangesBuilder

This builder produces an HTML overview of all *versionadded*, *versionchanged*, *deprecated* and *versionremoved* directives for the current *version*. This is useful to generate a changelog file, for example.

name = 'changes'

The builder's name, for the -b command line option.

format = ''

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>251</sup>[str<sup>252</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

class sphinx.builders.dummy.DummyBuilder

This builder produces no output. The input is only parsed and checked for consistency. This is useful for linting purposes.

```
name = 'dummy'
```

The builder's name, for the -b command line option.

```
supported_image_types: list<sup>253</sup>[str<sup>254</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.4.

class sphinx.builders.linkcheck.CheckExternalLinksBuilder

This builder scans all documents for external links, tries to open them with requests, and writes an overview which ones are broken and redirected to standard output and to output.txt in the output directory.

name = 'linkcheck'

The builder's name, for the -b command line option.

```
format = ''
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>255</sup>[str<sup>256</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

Changed in version 1.5: Since Sphinx 1.5, the linkcheck builder uses the requests module.

Changed in version 3.4: The linkcheck builder retries links when servers apply rate limits.

class sphinx.builders.xml.XMLBuilder

This builder produces Docutils-native XML files. The output can be transformed with standard XML tools such as XSLT processors into arbitrary final forms.

```
name = 'xml'
```

The builder's name, for the -b command line option.

²⁵¹ https://docs.python.org/3/library/stdtypes.html#list

²⁵² https://docs.python.org/3/library/stdtypes.html#str

²⁵³ https://docs.python.org/3/library/stdtypes.html#list

²⁵⁴ https://docs.python.org/3/library/stdtypes.html#str

²⁵⁵ https://docs.python.org/3/library/stdtypes.html#list

²⁵⁶ https://docs.python.org/3/library/stdtypes.html#str

format = 'xml'

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>257</sup>[str<sup>258</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.2.

class sphinx.builders.xml.PseudoXMLBuilder

This builder is used for debugging the Sphinx/Docutils "Reader to Transform to Writer" pipeline. It produces compact pretty-printed "pseudo-XML", files where nesting is indicated by indentation (no end-tags). External attributes for all elements are output, and internal attributes for any leftover "pending" elements are also given.

```
name = 'pseudoxml'
```

The builder's name, for the -b command line option.

```
format = 'pseudoxml'
```

The builder's output format, or "if no document output is produced.

```
supported_image_types: list<sup>259</sup>[str<sup>260</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

New in version 1.2.

Built-in Sphinx extensions that offer more builders are:

- doctest
- coverage

Serialization builder details

All serialization builders outputs one file per source file and a few special files. They also copy the reST source files in the directory _sources under the output directory.

The PickleHTMLBuilder is a builtin subclass that implements the pickle serialization interface.

The files per source file have the extensions of *out_suffix*, and are arranged in directories just as the source files are. They unserialize to a dictionary (or dictionary like structure) with these keys:

body

The HTML "body" (that is, the HTML rendering of the source file), as rendered by the HTML translator.

title

The title of the document, as HTML (may contain markup).

toc

The table of contents for the file, rendered as an HTML .

display_toc

A boolean that is True if the toc contains more than one entry.

current_page_name

The document name of the current file.

4.5. Builders 131

²⁵⁷ https://docs.python.org/3/library/stdtypes.html#list

²⁵⁸ https://docs.python.org/3/library/stdtypes.html#str

²⁵⁹ https://docs.python.org/3/library/stdtypes.html#list

²⁶⁰ https://docs.python.org/3/library/stdtypes.html#str

parents, prev and next

Information about related chapters in the TOC tree. Each relation is a dictionary with the keys link (HREF for the relation) and title (title of the related document, as HTML). parents is a list of relations, while prev and next are a single relation.

sourcename

The name of the source file under _sources.

The special files are located in the root output directory. They are:

SerializingHTMLBuilder.globalcontext_filename

A pickled dict with these keys:

project, copyright, release, version

The same values as given in the configuration file.

style

html_style.

last_updated

Date of last build.

builder

Name of the used builder, in the case of pickles this is always 'pickle'.

titles

A dictionary of all documents' titles, as HTML strings.

SerializingHTMLBuilder.searchindex_filename

An index that can be used for searching the documentation. It is a pickled list with these entries:

- A list of indexed docnames.
- A list of document titles, as HTML strings, in the same order as the first list.
- A dict mapping word roots (processed by an English-language stemmer) to a list of integers, which are indices into the first list.

environment.pickle

The build environment. This is always a pickle file, independent of the builder and a copy of the environment that was used when the builder was started.

Todo: Document common members.

Unlike the other pickle files this pickle file requires that the sphinx package is available on unpickling.

4.6 Domains

New in version 1.0.

Originally, Sphinx was conceived for a single project, the documentation of the Python language. Shortly afterwards, it was made available for everyone as a documentation tool, but the documentation of Python modules remained deeply built in – the most fundamental directives, like function, were designed for Python objects. Since Sphinx has become somewhat popular, interest developed in using it for many different purposes: C/C++ projects, JavaScript, or even reStructuredText markup (like in this documentation).

While this was always possible, it is now much easier to easily support documentation of projects using different programming languages or even ones not supported by the main Sphinx distribution, by providing a **domain** for every such purpose.

A domain is a collection of markup (reStructuredText *directives* and *roles*) to describe and link to *objects* belonging together, e.g. elements of a programming language. Directive and role names in a domain have names like domain:name, e.g. py:function. Domains can also provide custom indices (like the Python Module Index).

Having domains means that there are no naming problems when one set of documentation wants to refer to e.g. C++ and Python classes. It also means that extensions that support the documentation of whole new languages are much easier to write.

This section describes what the domains that are included with Sphinx provide. The domain API is documented as well, in the section *Domain API*.

Basic Markup

Most domains provide a number of *object description directives*, used to describe specific objects provided by modules. Each directive requires one or more signatures to provide basic information about what is being described, and the content should be the description.

A domain will typically keep an internal index of all entities to aid cross-referencing. Typically it will also add entries in the shown general index. If you want to suppress the addition of an entry in the shown index, you can give the directive option flag :no-index-entry:. If you want to exclude the object description from the table of contents, you can give the directive option flag :no-contents-entry:. If you want to typeset an object description, without even making it available for cross-referencing, you can give the directive option flag :no-index: (which implies :no-index-entry:). If you do not want to typeset anything, you can give the directive option flag :no-typesetting:. This can for example be used to create only a target and index entry for later reference. Though, note that not every directive in every domain may support these options.

New in version 3.2: The directive option noindexentry in the Python, C, C++, and Javascript domains.

New in version 5.2.3: The directive option: nocontentsentry: in the Python, C, C++, Javascript, and reStructured-Text domains.

New in version 7.2: The directive option no-typesetting in the Python, C, C++, Javascript, and reStructuredText domains.

Changed in version 7.2:

- The directive option :noindex: was renamed to :no-index:.
- The directive option :noindexentry: was renamed to :no-index-entry:.
- The directive option :nocontentsentry: was renamed to :no-contents-entry:.

The previous names are retained as aliases, but will be deprecated and removed in a future version of Sphinx.

An example using a Python domain directive:

This describes the two Python functions spam and ham. (Note that when signatures become too long, you can break them if you add a backslash to lines that are continued in the next line. Example:

(This example also shows how to use the :no-index: flag.)

The domains also provide roles that link back to these object descriptions. For example, to link to one of the functions described in the example above, you could say

```
The function :py:func:`spam` does a similar thing.
```

As you can see, both directive and role names contain the domain name and the directive name.

The directive option :no-typesetting: can be used to create a target (and index entry) which can later be referenced by the roles provided by the domain. This is particularly useful for literate programming:

```
.. py:function:: spam(eggs)
    :no-typesetting:
.. code::
    def spam(eggs):
        pass
The function :py:func:`spam` does nothing.
```

Default Domain

For documentation describing objects from solely one domain, authors will not have to state again its name at each directive, role, etc... after having specified a default. This can be done either via the config value *primary_domain* or via this directive:

.. default-domain:: name

Select a new default domain. While the *primary_domain* selects a global default, this only has an effect within the same file.

If no other default is selected, the Python domain (named py) is the default one, mostly for compatibility with documentation written for older versions of Sphinx.

Directives and roles that belong to the default domain can be mentioned without giving the domain name, i.e.

```
.. function:: pyfunc()
   Describes a Python function.
Reference to :func:`pyfunc`.
```

Cross-referencing syntax

For cross-reference roles provided by domains, the same facilities exist as for general cross-references. See *Cross-referencing syntax*.

In short:

- You may supply an explicit title and reference target: :role:`title <target>` will refer to *target*, but the link text will be *title*.
- If you prefix the content with !, no reference/hyperlink will be created.
- If you prefix the content with ~, the link text will only be the last component of the target. For example, :py:meth:`~Queue.get` will refer to Queue.Queue.get but only display get as the link text.

Built-in domains

The following domains are included within Sphinx:

The Standard Domain

New in version 1.0.

The so-called "standard" domain collects all markup that doesn't warrant a domain of its own. Its directives and roles are not prefixed with a domain name.

The standard domain is also where custom object descriptions, added using the add_object_type() API, are placed.

There is a set of directives allowing documenting command-line programs:

```
.. option:: name args, name args, ...
```

Describes a command line argument or switch. Option argument names should be enclosed in angle brackets. Examples:

```
.. option:: dest_dir

Destination directory.
.. option:: -m <module>, --module <module>
Run a module as a script.
```

The directive will create cross-reference targets for the given options, referenceable by *option* (in the example case, you'd use something like :option:`-m`, or :option:`-module`).

Changed in version 5.3: One can cross-reference including an option value: :option:`--module=foobar`, ,``:option:-module[=foobar]``or:option:`--module foobar`.

Use option_emphasise_placeholders for parsing of "variable part" of a literal text (similarly to the samp role).

cmdoption directive is a deprecated alias for the option directive.

.. envvar:: name

Describes an environment variable that the documented code or program uses or defines. Referenceable by *envvar*.

.. program:: name

Like *py:currentmodule*, this directive produces no output. Instead, it serves to notify Sphinx that all following *option* directives document options for the program called *name*.

If you use *program*, you have to qualify the references in your *option* roles by the program name, so if you have the following situation

```
.. program:: rm
.. option:: -r
Work recursively.
.. program:: svn
```

(continues on next page)

(continued from previous page)

```
.. option:: -r <revision>

Specify the revision to work upon.
```

then :option:`rm -r` would refer to the first option, while :option:`svn -r` would refer to the second one.

If None is passed to the argument, the directive will reset the current program name.

The program name may contain spaces (in case you want to document subcommands like svn add and svn commit separately).

New in version 0.5.

There is also a very generic object description directive, which is not tied to any domain:

.. describe:: text
.. object:: text

This directive produces the same formatting as the specific ones provided by domains, but does not create index entries or cross-referencing targets. Example:

```
.. describe:: PAPER

You can set this variable to select a paper size.
```

The C Domain

New in version 1.0.

The C domain (name c) is suited for documentation of C API.

.. c:member:: declaration

.. c:var:: declaration

Describes a C struct member or variable. Example signature:

```
.. c:member:: PyObject *PyTypeObject.tp_bases
```

The difference between the two directives is only cosmetic.

.. c:function:: function prototype

Describes a C function. The signature should be given as in C, e.g.:

```
.. c:function:: PyObject *PyType_GenericAlloc(PyTypeObject *type, Py_ssize_t nitems)
```

Note that you don't have to backslash-escape asterisks in the signature, as it is not parsed by the reST inliner.

In the description of a function you can use the following info fields (see also *Info field lists*).

- param, parameter, arg, argument, Description of a parameter.
- type: Type of a parameter, written as if passed to the *c:expr* role.
- returns, return: Description of the return value.
- rtype: Return type, written as if passed to the *c:expr* role.
- retval, retvals: An alternative to returns for describing the result of the function.

New in version 4.3: The retval field type.

For example:

```
.. c:function:: PyObject *PyType_GenericAlloc(PyTypeObject *type, Py_ssize_t nitems)

:param type: description of the first parameter.
:param nitems: description of the second parameter.
:returns: a result.
:retval NULL: under some conditions.
:retval NULL: under some other conditions as well.
```

which renders as

PyObject²⁶¹ *PyType_GenericAlloc(PyTypeObject²⁶² *type, Py_ssize_t²⁶³ nitems)

No-contents-entry

No-index-entry

Parameters

- **type** description of the first parameter.
- **nitems** description of the second parameter.

Returns

a result.

Return values

- **NULL** under some conditions.
- NULL under some other conditions as well.

:single-line-parameter-list: (no value)

Ensures that the function's parameters will be emitted on a single logical line, overriding *c_maximum_signature_line_length* and *maximum_signature_line_length*.

New in version 7.1.

.. c:macro:: name

.. c:macro:: name(arg list)

Describes a C macro, i.e., a C-language #define, without the replacement text.

In the description of a macro you can use the same info fields as for the c:function directive.

New in version 3.0: The function style variant.

:single-line-parameter-list: (no value)

Ensures that the macro's parameters will be emitted on a single logical line, overriding c_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

.. c:struct:: name

Describes a C struct.

New in version 3.0.

²⁶¹ https://docs.python.org/3/c-api/structures.html#c.PyObject

²⁶¹ https://docs.python.org/3/c-api/structures.html#c.PyObject

²⁶² https://docs.python.org/3/c-api/type.html#c.PyTypeObject

²⁶³ https://docs.python.org/3/c-api/intro.html#c.Py_ssize_t

```
.. c:union:: name
     Describes a C union.
     New in version 3.0.
.. c:enum:: name
     Describes a C enum.
     New in version 3.0.
.. c:enumerator:: name
     Describes a C enumerator.
     New in version 3.0.
.. c:type:: typedef-like declaration
.. c:type:: name
     Describes a C type, either as a typedef, or the alias for an unspecified type.
```

Cross-referencing C constructs

The following roles create cross-references to C-language constructs if they are defined in the documentation:

```
:c:member:
:c:data:
:c:var:
:c:func:
:c:macro:
:c:struct:
:c:union:
:c:enum:
:c:enumerator:
:c:type:
     Reference a C declaration, as defined above. Note that c:member, c:data, and c:var are equivalent.
```

New in version 3.0: The var, struct, union, enum, and enumerator roles.

Anonymous Entities

C supports anonymous structs, enums, and unions. For the sake of documentation they must be given some name that starts with @, e.g., @42 or @data. These names can also be used in cross-references, though nested symbols will be found even when omitted. The @... name will always be rendered as [anonymous] (possibly as a link).

Example:

```
.. c:struct:: Data
  .. c:union:: @data
      .. c:var:: int a
      .. c:var:: double b
```

(continues on next page)

(continued from previous page)

```
Explicit ref: :c:var:`Data.@data.a`. Short-hand ref: :c:var:`Data.a`.
```

This will be rendered as:

struct Data

union [anonymous]

int a

double **b**

Explicit ref: Data. [anonymous].a. Short-hand ref: Data.a.

New in version 3.0.

Aliasing Declarations

Sometimes it may be helpful list declarations elsewhere than their main documentation, e.g., when creating a synopsis of an interface. The following directive can be used for this purpose.

.. c:alias:: name

Insert one or more alias declarations. Each entity can be specified as they can in the c:any role.

For example:

becomes

int data

int **f**(double k)

int data

int f(double k)

New in version 3.2.

Options

:maxdepth: int

Insert nested declarations as well, up to the total depth given. Use 0 for infinite depth and 1 for just the mentioned declaration. Defaults to 1.

New in version 3.3.

:noroot:

Skip the mentioned declarations and only render nested declarations. Requires \max depth either 0 or at least 2.

New in version 3.5.

Inline Expressions and Types

```
:c:expr:
```

:c:texpr:

Insert a C expression or type either as inline code (cpp:expr) or inline text (cpp:texpr). For example:

```
.. c:var:: int a = 42
.. c:function:: int f(int i)
An expression: :c:expr:`a * f(a)` (or as text: :c:texpr:`a * f(a)`).
A type: :c:expr:`const Data*`
(or as text :c:texpr:`const Data*`).
```

will be rendered as follows:

```
int a = 42
int f(int i)
An expression: a * f(a) (or as text: a * f(a)).
A type: const Data* (or as text const Data*).
New in version 3.0.
```

Namespacing

New in version 3.1.

The C language it self does not support namespacing, but it can sometimes be useful to emulate it in documentation, e.g., to show alternate declarations. The feature may also be used to document members of structs/unions/enums separate from their parent declaration.

The current scope can be changed using three namespace directives. They manage a stack declarations where c:namespace resets the stack and changes a given scope.

The c:namespace-push directive changes the scope to a given inner scope of the current one.

The c:namespace-pop directive undoes the most recent c:namespace-push directive.

```
.. c:namespace:: scope specification
```

Changes the current scope for the subsequent objects to the given scope, and resets the namespace directive stack. Note that nested scopes can be specified by separating with a dot, e.g.:

```
.. c:namespace:: Namespace1.Namespace2.SomeStruct.AnInnerStruct
```

All subsequent objects will be defined as if their name were declared with the scope prepended. The subsequent cross-references will be searched for starting in the current scope.

Using NULL or 0 as the scope will change to global scope.

```
.. c:namespace-push:: scope specification
```

Change the scope relatively to the current scope. For example, after:

```
.. c:namespace:: A.B
.. c:namespace-push:: C.D
```

the current scope will be A.B.C.D.

.. c:namespace-pop::

Undo the previous c:namespace-push directive (not just pop a scope). For example, after:

```
.. c:namespace:: A.B
.. c:namespace-push:: C.D
.. c:namespace-pop::
```

the current scope will be A.B (not A.B.C).

If no previous c:namespace-push directive has been used, but only a c:namespace directive, then the current scope will be reset to global scope. That is, . . c:namespace:: A.B is equivalent to:

```
.. c:namespace:: NULL
.. c:namespace-push:: A.B
```

Configuration Variables

See Options for the C domain.

The C++ Domain

New in version 1.0.

The C++ domain (name **cpp**) supports documenting C++ projects.

Directives for Declaring Entities

The following directives are available. All declarations can start with a visibility statement (public, private or protected).

```
\dots cpp:class:: class specifier
```

.. cpp:struct:: class specifier

Describe a class/struct, possibly with specification of inheritance, e.g.,:

```
.. cpp:class:: MyClass : public MyBase, MyOtherBase
```

The difference between *cpp:class* and *cpp:struct* is only cosmetic: the prefix rendered in the output, and the specifier shown in the index.

The class can be directly declared inside a nested scope, e.g.,:

```
.. cpp:class:: OuterScope::MyClass : public MyBase, MyOtherBase
```

A class template can be declared:

```
.. cpp:class:: template<typename T, std::size_t N> std::array
```

or with a line break:

Full and partial template specialisations can be declared:

New in version 2.0: The *cpp:struct* directive.

.. cpp:function:: (member) function prototype

Describe a function or member function, e.g.,:

```
.. cpp:function:: bool myMethod(int arg1, std::string arg2)
    A function with parameters and types.
.. cpp:function:: bool myMethod(int, double)
    A function with unnamed parameters.
.. cpp:function:: const T &MyClass::operator[](std::size_t i) const
    An overload for the indexing operator.
.. cpp:function:: operator bool() const
    A casting operator.
.. cpp:function:: constexpr void foo(std::string &bar[2]) noexcept
    A constexpr function.
.. cpp:function:: MyClass::MyClass(const MyClass&) = default
    A copy constructor with default implementation.
```

Function templates can also be described:

and function template specialisations:

```
:single-line-parameter-list: (no value)
```

Ensures that the function's parameters will be emitted on a single logical line, overriding <code>cpp_maximum_signature_line_length</code> and <code>maximum_signature_line_length</code>.

New in version 7.1.

- .. cpp:member:: (member) variable declaration
- .. cpp:var:: (member) variable declaration

Describe a variable or member variable, e.g.,:

```
.. cpp:member:: std::string MyClass::myMember
.. cpp:var:: std::string MyClass::myOtherMember[N][M]
.. cpp:member:: int a = 42
```

Variable templates can also be described:

- .. cpp:type:: typedef declaration
- .. cpp:type:: name
- .. cpp:type:: type alias declaration

Describe a type as in a typedef declaration, a type alias declaration, or simply the name of a type with unspecified type, e.g.,:

```
.. cpp:type:: std::vector<int> MyList
    A typedef-like declaration of a type.
.. cpp:type:: MyContainer::const_iterator
    Declaration of a type alias with unspecified type.
.. cpp:type:: MyType = std::unordered_map<int, std::string>
    Declaration of a type alias.
```

A type alias can also be templated:

The example are rendered as follows.

typedef std::vector<int> MyList

A typedef-like declaration of a type.

type MyContainer::const_iterator

Declaration of a type alias with unspecified type.

using MyType = std::unordered_map<int, std::string>

Declaration of a type alias.

template<typename T>

using **MyContainer** = std::vector<*T*>

- .. cpp:enum:: unscoped enum declaration
- .. cpp:enum-struct:: scoped enum declaration
- .. cpp:enum-class:: scoped enum declaration

Describe a (scoped) enum, possibly with the underlying type specified. Any enumerators declared inside an unscoped enum will be declared both in the enum scope and in the parent scope. Examples:

- .. cpp:enumerator:: name
- .. cpp:enumerator:: name = constant

Describe an enumerator, optionally with its value defined, e.g.,:

```
.. cpp:enumerator:: MyEnum::myEnumerator
.. cpp:enumerator:: MyEnum::myOtherEnumerator = 42
```

.. cpp:union:: name

Describe a union.

New in version 1.8.

.. cpp:concept:: template-parameter-list name

Warning: The support for concepts is experimental. It is based on the current draft standard and the Concepts Technical Specification. The features may change as they evolve.

Describe a concept. It must have exactly 1 template parameter list. The name may be a nested name. Example:

```
.. cpp:concept:: template<typename It> std::Iterator

Proxy to an element of a notional sequence that can be compared,
  indirected, or incremented.

**Notation**
```

(continues on next page)

(continued from previous page)

```
.. cpp:var:: It r
An lvalue.

**Valid Expressions**

- :cpp:expr:`*r`, when :cpp:expr:`r` is dereferenceable.
- :cpp:expr:`++r`, with return type :cpp:expr:`It&`, when :cpp:expr:`r` is incrementable.
```

This will render as follows:

```
template<typename It>
concept std::Iterator
```

Proxy to an element of a notional sequence that can be compared, indirected, or incremented.

Notation

It \mathbf{r}

An lvalue.

Valid Expressions

- *r, when r is dereferenceable.
- ++r, with return type *It*&, when r is incrementable.

New in version 1.5.

Options

Some directives support options:

- :no-index-entry: and :no-contents-entry:, see Basic Markup.
- :tparam-line-spec:, for templated declarations. If specified, each template parameter will be rendered on a separate line.

New in version 1.6.

Anonymous Entities

C++ supports anonymous namespaces, classes, enums, and unions. For the sake of documentation they must be given some name that starts with @, e.g., @42 or @data. These names can also be used in cross-references and (type) expressions, though nested symbols will be found even when omitted. The @... name will always be rendered as [anonymous] (possibly as a link).

Example:

```
.. cpp:class:: Data
.. cpp:union:: @data
.. cpp:var:: int a
(continues on next page)
```

(continued from previous page)

```
.. cpp:var:: double b

Explicit ref: :cpp:var:`Data::@data::a`. Short-hand ref: :cpp:var:`Data::a`.

This will be rendered as:
class Data

union [anonymous]

int a

double b

Explicit ref: Data::[anonymous]::a. Short-hand ref: Data::a.

New in version 1.8.
```

Aliasing Declarations

Sometimes it may be helpful list declarations elsewhere than their main documentation, e.g., when creating a synopsis of a class interface. The following directive can be used for this purpose.

.. cpp:alias:: name or function signature

Insert one or more alias declarations. Each entity can be specified as they can in the *cpp:any* role. If the name of a function is given (as opposed to the complete signature), then all overloads of the function will be listed.

For example:

becomes

 $\operatorname{void} f(\operatorname{double} d) \operatorname{const} \\ \operatorname{void} f(\operatorname{double} d)$

New in version 2.0.

Options

:maxdepth: int

Insert nested declarations as well, up to the total depth given. Use 0 for infinite depth and 1 for just the mentioned declaration. Defaults to 1.

New in version 3.5.

:noroot:

Skip the mentioned declarations and only render nested declarations. Requires maxdepth either 0 or at least 2.

New in version 3.5.

Constrained Templates

Warning: The support for concepts is experimental. It is based on the current draft standard and the Concepts Technical Specification. The features may change as they evolve.

Note: Sphinx does not currently support requires clauses.

Placeholders

Declarations may use the name of a concept to introduce constrained template parameters, or the keyword auto to introduce unconstrained template parameters:

```
.. cpp:function:: void f(auto &&arg)
```

A function template with a single unconstrained template parameter.

```
.. cpp:function:: void f(std::Iterator it)
```

A function template with a single template parameter, constrained by the Iterator concept.

Template Introductions

Simple constrained function or class templates can be declared with a *template introduction* instead of a template parameter list:

```
.. cpp:function:: std::Iterator{It} void advance(It &it)
```

A function template with a template parameter constrained to be an $\ensuremath{\operatorname{Iterator}}$.

.. cpp:class:: std::LessThanComparable{T} MySortedContainer

(continues on next page)

(continued from previous page)

```
A class template with a template parameter constrained to be LessThanComparable.
```

They are rendered as follows.

```
std::Iterator{It}
void advance(It &it)
```

A function template with a template parameter constrained to be an Iterator.

std::LessThanComparable{T}
class MySortedContainer

A class template with a template parameter constrained to be LessThanComparable.

Note however that no checking is performed with respect to parameter compatibility. E.g., $Iterator\{A, B, C\}$ will be accepted as an introduction even though it would not be valid C++.

Inline Expressions and Types

:cpp:expr:

:cpp:texpr:

Insert a C++ expression or type either as inline code (cpp:expr) or inline text (cpp:texpr). For example:

```
.. cpp:var:: int a = 42
.. cpp:function:: int f(int i)
An expression: :cpp:expr:`a * f(a)` (or as text: :cpp:texpr:`a * f(a)`).
A type: :cpp:expr:`const MySortedContainer<int>&`
  (or as text :cpp:texpr:`const MySortedContainer<int>&`).
```

will be rendered as follows:

```
int \mathbf{a} = 42
int \mathbf{f}(int i)
```

An expression: a * f(a) (or as text: a * f(a)).

A type: const MySortedContainer<int>& (or as text const MySortedContainer<int>&).

New in version 1.7: The *cpp:expr* role.

New in version 1.8: The *cpp:texpr* role.

Namespacing

Declarations in the C++ domain are as default placed in global scope. The current scope can be changed using three namespace directives. They manage a stack declarations where cpp:namespace resets the stack and changes a given scope.

The cpp:namespace-push directive changes the scope to a given inner scope of the current one.

The cpp:namespace-pop directive undoes the most recent cpp:namespace-push directive.

.. cpp:namespace:: scope specification

Changes the current scope for the subsequent objects to the given scope, and resets the namespace directive stack. Note that the namespace does not need to correspond to C++ namespaces, but can end in names of classes, e.g.,:

```
.. cpp:namespace:: Namespace1::Namespace2::SomeClass::AnInnerClass
```

All subsequent objects will be defined as if their name were declared with the scope prepended. The subsequent cross-references will be searched for starting in the current scope.

Using NULL, 0, or nullptr as the scope will change to global scope.

A namespace declaration can also be templated, e.g.,:

declares size as a member function of the class template std::vector. Equivalently this could have been declared using:

or:

.. cpp:namespace-push:: scope specification

Change the scope relatively to the current scope. For example, after:

```
.. cpp:namespace:: A::B
.. cpp:namespace-push:: C::D
```

the current scope will be A::B::C::D.

New in version 1.4.

.. cpp:namespace-pop::

Undo the previous cpp:namespace-push directive (not just pop a scope). For example, after:

```
.. cpp:namespace:: A::B
.. cpp:namespace-push:: C::D
.. cpp:namespace-pop::
```

the current scope will be A::B (not A::B::C).

If no previous cpp:namespace-push directive has been used, but only a cpp:namespace directive, then the current scope will be reset to global scope. That is, .. cpp:namespace:: A::B is equivalent to:

```
.. cpp:namespace:: nullptr
.. cpp:namespace-push:: A::B
```

New in version 1.4.

Info field lists

All the C++ directives for declaring entities support the following info fields (see also *Info field lists*):

• tparam: Description of a template parameter.

The *cpp:function* directive additionally supports the following fields:

- param, parameter, arg, argument: Description of a parameter.
- returns, return: Description of a return value.
- retval, retvals: An alternative to returns for describing the result of the function.
- throws, throw, exception: Description of a possibly thrown exception.

New in version 4.3: The retval field type.

Cross-referencing

These roles link to the given declaration types:

```
:cpp:any:
:cpp:class:
:cpp:struct:
:cpp:func:
:cpp:member:
:cpp:var:
:cpp:type:
:cpp:concept:
:cpp:enum:
:cpp:enumerator:
```

Reference a C++ declaration by name (see below for details). The name must be properly qualified relative to the position of the link.

New in version 2.0: The *cpp:struct* role as alias for the *cpp:class* role.

Note on References with Templates Parameters/Arguments

These roles follow the Sphinx *Cross-referencing syntax* rules. This means care must be taken when referencing a (partial) template specialization, e.g. if the link looks like this: :cpp:class:`MyClass<int>`. This is interpreted as a link to int with a title of MyClass. In this case, escape the opening angle bracket with a backslash, like this: :cpp:class:`MyClass\<int>`.

When a custom title is not needed it may be useful to use the roles for inline expressions, *cpp:expr* and *cpp:texpr*, where angle brackets do not need escaping.

Declarations without template parameters and template arguments

For linking to non-templated declarations the name must be a nested name, e.g., f or MyClass::f.

Overloaded (member) functions

When a (member) function is referenced using just its name, the reference will point to an arbitrary matching overload. The *cpp:any* and *cpp:func* roles use an alternative format, which simply is a complete function declaration. This will resolve to the exact matching overload. As example, consider the following class declaration:

class C

```
void f(double d) const
void f(double d)
void f(int i)
void f()
```

References using the cpp: func role:

- Arbitrary overload: C::f, C::f()
- Also arbitrary overload: C::f(), C::f()
- Specific overload: void C::f(), void C::f()
- Specific overload: void C::f(int), void C::f(int)
- Specific overload: void C::f(double), void C::f(double)
- Specific overload: void C::f(double) const, void C::f(double) const

Note that the add_function_parentheses configuration variable does not influence specific overload references.

Templated declarations

Assume the following declarations.

class Wrapper

```
template<typename TOuter>
class Outer

template<typename TInner>
```

class Inner

In general the reference must include the template parameter declarations, and template arguments for the prefix of qualified names. For example:

- template\<typename TOuter> Wrapper::Outer(template<typename TOuter> Wrapper::Outer)
- template\<typename TOuter> template\<typename TInner> Wrapper::Outer<TOuter>::Inner (template<typename TOuter> template<typename TInner> Wrapper::Outer<TOuter>::Inner)

Currently the lookup only succeed if the template parameter identifiers are equal strings. That is, template <typename UOuter> Wrapper::Outer will not work.

As a shorthand notation, if a template parameter list is omitted, then the lookup will assume either a primary template or a non-template, but not a partial template specialisation. This means the following references work as well:

```
    Wrapper::Outer (Wrapper::Outer)
    Wrapper::Outer::Inner (Wrapper::Outer::Inner)
    template\<typename TInner> Wrapper::Outer::Inner
    Wrapper::Outer::Inner)
```

(Full) Template Specialisations

```
Assume the following declarations.

template<typename TOuter>
class Outer

template<typename TInner>
class Inner

template<>
class Outer<int>

template<typename TInner>
class Inner

template<<>
class Inner

template<>>
class Inner
```

In general the reference must include a template parameter list for each template argument list. The full specialisation above can therefore be referenced with template\<> Outer\<int>:(template<> Outer<int>) and template\<> template<<> Outer<int>::Inner<bool>). As a shorthand the empty template parameter list can be omitted, e.g., Outer\<int>:(Outer<int>) and Outer\<int>::Inner<bool>).

Partial Template Specialisations

Assume the following declaration.

```
template<typename T> class Outer<T*>
```

References to partial specialisations must always include the template parameter lists, e.g., template<typename T> Outer<T*>> Currently the lookup only succeed if the template parameter identifiers are equal strings.

Configuration Variables

See *Options for the C++ domain*.

The JavaScript Domain

New in version 1.0.

The JavaScript domain (name **js**) provides the following directives:

.. js:module:: name

This directive sets the module name for object declarations that follow after. The module name is used in the global module index and in cross references. This directive does not create an object heading like *py:class* would, for example.

By default, this directive will create a linkable entity and will cause an entry in the global module index, unless the no-index option is specified. If this option is specified, the directive will only update the current module name.

New in version 1.6.

Changed in version 5.2: Module directives support body content.

.. js:function:: name(signature)

Describes a JavaScript function or method. If you want to describe arguments as optional use square brackets as *documented* for Python signatures.

You can use fields to give more details about arguments and their expected types, errors which may be thrown by the function, and the value being returned:

```
.. js:function:: $.getJSON(href, callback[, errback])

:param string href: An URI to the location of the resource.
:param callback: Gets called with the object.
:param errback:
    Gets called in case the request fails. And a lot of other
    text so we need multiple lines.
:throws SomeError: For whatever reason in that case.
:returns: Something.
```

This is rendered as:

\$.getJSON(href, callback[, errback])

Arguments

- **href** (string()) An URI to the location of the resource.
- **callback** Gets called with the object.
- **errback** Gets called in case the request fails. And a lot of other text so we need multiple lines.

Throws

SomeError() – For whatever reason in that case.

Returns

Something.

:single-line-parameter-list: (no value)

Ensures that the function's parameters will be emitted on a single logical line, overriding <code>javascript_maximum_signature_line_length</code> and <code>maximum_signature_line_length</code>.

New in version 7.1.

.. js:method:: name(signature)

This directive is an alias for *js:function*, however it describes a function that is implemented as a method on a class object.

New in version 1.6.

:single-line-parameter-list: (no value)

Ensures that the function's parameters will be emitted on a single logical line, overriding <code>javascript_maximum_signature_line_length</code> and <code>maximum_signature_line_length</code>.

New in version 7.1.

.. js:class:: name

Describes a constructor that creates an object. This is basically like a function but will show up with a *class* prefix:

```
.. js:class:: MyAnimal(name[, age])

:param string name: The name of the animal
:param number age: an optional age for the animal
```

This is rendered as:

class MyAnimal(name[, age])

Arguments

- **name** (string()) The name of the animal
- age (number()) an optional age for the animal

:single-line-parameter-list: (no value)

Ensures that the function's parameters will be emitted on a single logical line, overriding <code>javascript_maximum_signature_line_length</code> and <code>maximum_signature_line_length</code>.

New in version 7.1.

.. js:data:: name

Describes a global variable or constant.

.. js:attribute:: object.name

Describes the attribute name of object.

These roles are provided to refer to the described objects:

```
:js:mod:
:js:func:
:js:meth:
:js:class:
:js:data:
:js:attr:
```

The Mathematics Domain

New in version 1.8.

The math domain (name **math**) provides the following roles:

:math:numref:

Role for cross-referencing equations defined by *math* directive via their label. Example:

```
.. math:: e^{i\pi} + 1 = 0
    :label: euler

Euler's identity, equation :math:numref:`euler`, was elected one of the most beautiful mathematical formulas.
```

New in version 1.8.

The Python Domain

New in version 1.0.

The Python domain (name **py**) provides the following directives for module declarations:

```
.. py:module:: name
```

This directive marks the beginning of the description of a module (or package submodule, in which case the name should be fully qualified, including the package name). A description of the module such as the docstring can be placed in the body of the directive.

This directive will also cause an entry in the global module index.

Changed in version 5.2: Module directives support body content.

options

```
:platform: platforms (comma separated list)
```

Indicate platforms which the module is available (if it is available on all platforms, the option should be omitted). The keys are short identifiers; examples that are in use include "IRIX", "Mac", "Windows" and "Unix". It is important to use a key which has already been used when applicable.

```
:synopsis: purpose (text)
```

Consist of one sentence describing the module's purpose – it is currently only used in the Global Module Index.

```
:deprecated: (no argument)
```

Mark a module as deprecated; it will be designated as such in various locations then.

```
.. py:currentmodule:: name
```

This directive tells Sphinx that the classes, functions etc. documented from here are in the given module (like <code>py:module</code>), but it will not create index entries, an entry in the Global Module Index, or a link target for <code>py:mod</code>. This is helpful in situations where documentation for things in a module is spread over multiple files or sections – one location has the <code>py:module</code> directive, the others only <code>py:currentmodule</code>.

The following directives are provided for module and class contents:

```
.. py:function:: name(parameters)
```

.. py:function:: name[type parameters](parameters)

Describes a module-level function. The signature should include the parameters, together with optional type parameters, as given in the Python function definition, see *Python Signatures*. For example:

```
.. py:function:: Timer.repeat(repeat=3, number=1_000_000)
.. py:function:: add[T](a: T, b: T) -> T
```

For methods you should use py:method.

The description normally includes information about the parameters required and how they are used (especially whether mutable objects passed as parameters are modified), side effects, and possible exceptions.

This information can (in any py directive) optionally be given in a structured form, see *Info field lists*.

options

:async: (no value)

Indicate the function is an async function.

New in version 2.1.

:canonical: (full qualified name including module name)

Describe the location where the object is defined if the object is imported from other modules

New in version 4.0.

:single-line-parameter-list: (no value)

Ensures that the function's arguments will be emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

:single-line-type-parameter-list: (no value)

Ensure that the function's type parameters are emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

.. py:data:: name

Describes global data in a module, including both variables and values used as "defined constants." Class and object attributes are not documented using this environment.

options

:type: type of the variable (text)

New in version 2.4.

:value: initial value of the variable (text)

New in version 2.4.

:canonical: (full qualified name including module name)

Describe the location where the object is defined if the object is imported from other modules

New in version 4.0.

```
.. py:exception:: name
```

.. py:exception:: name(parameters)

.. py:exception:: name[type parameters](parameters)

Describes an exception class. The signature can, but need not include parentheses with constructor arguments, or may optionally include type parameters (see **PEP 695**²⁶⁴).

options

:final: (no value)

Indicate the class is a final class.

New in version 3.1.

:single-line-parameter-list: (no value)

See py:class:single-line-parameter-list.

New in version 7.1.

:single-line-type-parameter-list: (no value)

See py:class:single-line-type-parameter-list.

New in version 7.1.

- .. py:class:: name
- .. py:class:: name(parameters)
- .. py:class:: name[type parameters](parameters)

Describes a class. The signature can optionally include type parameters (see PEP 695²⁶⁵) or parentheses with parameters which will be shown as the constructor arguments. See also *Python Signatures*.

Methods and attributes belonging to the class should be placed in this directive's body. If they are placed outside, the supplied name should contain the class name so that cross-references still work. Example:

The first way is the preferred one.

options

:canonical: (full qualified name including module name)

Describe the location where the object is defined if the object is imported from other modules

New in version 4.0.

:final: (no value)

Indicate the class is a final class.

New in version 3.1.

²⁶⁴ https://peps.python.org/pep-0695/

:single-line-parameter-list: (no value)

Ensures that the class constructor's arguments will be emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

:single-line-type-parameter-list: (no value)

Ensure that the class type parameters are emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

.. py:attribute:: name

Describes an object data attribute. The description should include information about the type of the data to be expected and whether it may be changed directly.

options

:type: type of the attribute (text)

New in version 2.4.

:value: initial value of the attribute (text)

New in version 2.4.

:canonical: (full qualified name including module name)

Describe the location where the object is defined if the object is imported from other modules

New in version 4.0.

.. py:property:: name

Describes an object property.

New in version 4.0.

options

:abstractmethod: (no value)

Indicate the property is abstract.

:classmethod: (no value)

Indicate the property is a classmethod.

New in version 4.2.

:type: type of the property (text)

- .. py:method:: name(parameters)
- .. py:method:: name[type parameters](parameters)

Describes an object method. The parameters should not include the self parameter. The description should include similar information to that described for function. See also *Python Signatures* and *Info field lists*.

²⁶⁵ https://peps.python.org/pep-0695/

options

:abstractmethod: (no value)

Indicate the method is an abstract method.

New in version 2.1.

:async: (no value)

Indicate the method is an async method.

New in version 2.1.

:canonical: (full qualified name including module name)

Describe the location where the object is defined if the object is imported from other modules

New in version 4.0.

:classmethod: (no value)

Indicate the method is a class method.

New in version 2.1.

:final: (no value)

Indicate the method is a final method.

New in version 3.1.

:single-line-parameter-list: (no value)

Ensures that the method's arguments will be emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

:single-line-type-parameter-list: (no value)

Ensure that the method's type parameters are emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.2.

:staticmethod: (no value)

Indicate the method is a static method.

New in version 2.1.

```
.. py:staticmethod:: name(parameters)
```

.. py:staticmethod:: name[type parameters](parameters)

Like *py:method*, but indicates that the method is a static method.

New in version 0.4.

- .. py:classmethod:: name(parameters)
- .. py:classmethod:: name[type parameters](parameters)

Like *py:method*, but indicates that the method is a class method.

New in version 0.6.

.. py:decorator:: name

.. py:decorator:: name(parameters)

.. py:decorator:: name[type parameters](parameters)

Describes a decorator function. The signature should represent the usage as a decorator. For example, given the functions

```
def removename(func):
    func.__name__ = ''
    return func

def setnewname(name):
    def decorator(func):
        func.__name__ = name
        return func
    return decorator
```

the descriptions should look like this:

```
.. py:decorator:: removename

Remove name of the decorated function.
.. py:decorator:: setnewname(name)

Set name of the decorated function to *name*.
```

```
(as opposed to .. py:decorator:: removename(func).)
```

There is no py:deco role to link to a decorator that is marked up with this directive; rather, use the py:func role.

:single-line-parameter-list: (no value)

Ensures that the decorator's arguments will be emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.1.

:single-line-type-parameter-list: (no value)

Ensure that the decorator's type parameters are emitted on a single logical line, overriding python_maximum_signature_line_length and maximum_signature_line_length.

New in version 7.2.

```
.. py:decoratormethod:: name
```

- .. py:decoratormethod:: name(signature)
- .. py:decoratormethod:: name[type parameters](signature)

Same as *py:decorator*, but for decorators that are methods.

Refer to a decorator method using the py:meth role.

Python Signatures

Signatures of functions, methods and class constructors can be given like they would be written in Python.

Default values for optional arguments can be given (but if they contain commas, they will confuse the signature parser). Python 3-style argument annotations can also be given as well as return type annotations:

```
.. py:function:: compile(source : string, filename, symbol='file') -> ast object
```

For functions with optional parameters that don't have default values (typically functions implemented in C extension modules without keyword argument support), you can use brackets to specify the optional parts:

```
compile(source[, filename[, symbol]])
```

It is customary to put the opening bracket before the comma.

Python 3.12 introduced *type parameters*, which are type variables declared directly within the class or function definition:

```
class AnimalList[AnimalT](list[AnimalT]):
    ...

def add[T](a: T, b: T) -> T:
    return a + b
```

The corresponding reStructuredText documentation would be:

```
.. py:class:: AnimalList[AnimalT]
.. py:function:: add[T](a: T, b: T) -> T
```

See PEP 695²⁶⁶ and PEP 696²⁶⁷ for details and the full specification.

Info field lists

New in version 0.4.

Changed in version 3.0: meta fields are added.

Inside Python object description directives, reST field lists with these fields are recognized and formatted nicely:

- param, parameter, arg, argument, key, keyword: Description of a parameter.
- type: Type of a parameter. Creates a link if possible.
- raises, raise, except, exception: That (and when) a specific exception is raised.
- var, ivar, cvar: Description of a variable.
- vartype: Type of a variable. Creates a link if possible.
- returns, return: Description of the return value.
- rtype: Return type. Creates a link if possible.
- meta: Add metadata to description of the python object. The metadata will not be shown on output document. For example, :meta private: indicates the python object is private member. It is used in *sphinx.ext.autodoc* for filtering members.

²⁶⁶ https://peps.python.org/pep-0695/

²⁶⁷ https://peps.python.org/pep-0696/

Note: In current release, all var, ivar and cvar are represented as "Variable". There is no difference at all.

The field names must consist of one of these keywords and an argument (except for returns and rtype, which do not need an argument). This is best explained by an example:

```
.. py:function:: send_message(sender, recipient, message_body, [priority=1])

Send a message to a recipient

:param str sender: The person sending the message
:param str recipient: The recipient of the message
:param str message_body: The body of the message
:param priority: The priority of the message, can be a number 1-5
:type priority: integer or None
:return: the message id
:rtype: int
:raises ValueError: if the message_body exceeds 160 characters
:raises TypeError: if the message_body is not a basestring
```

This will render like this:

```
send_message(sender, recipient, message_body[, priority=1])
```

Send a message to a recipient

Parameters

- **sender** (str^{268}) The person sending the message
- **recipient** (str^{269}) The recipient of the message
- message_body (str²⁷⁰) The body of the message
- **priority** (int²⁷¹ or None) The priority of the message, can be a number 1-5

Returns

the message id

Return type

 int^{272}

Raises

- **ValueError**²⁷³ if the message_body exceeds 160 characters
- **TypeError**²⁷⁴ if the message body is not a basestring

It is also possible to combine parameter type and description, if the type is a single word, like this:

```
:param int priority: The priority of the message, can be a number 1-5
```

New in version 1.5.

Container types such as lists and dictionaries can be linked automatically using the following syntax:

```
<sup>268</sup> https://docs.python.org/3/library/stdtypes.html#str
```

²⁶⁹ https://docs.python.org/3/library/stdtypes.html#str

²⁷⁰ https://docs.python.org/3/library/stdtypes.html#str

https://docs.python.org/3/library/functions.html#int

²⁷² https://docs.python.org/3/library/functions.html#int

²⁷³ https://docs.python.org/3/library/exceptions.html#ValueError

²⁷⁴ https://docs.python.org/3/library/exceptions.html#TypeError

```
:type priorities: list(int)
:type priorities: list[int]
:type mapping: dict(str, int)
:type mapping: dict[str, int]
:type point: tuple(float, float)
:type point: tuple[float, float]
```

Multiple types in a type field will be linked automatically if separated by the word "or":

```
:type an_arg: int or None
:vartype a_var: str or int
:rtype: float or str
```

Cross-referencing Python objects

The following roles refer to objects in modules and are possibly hyperlinked if a matching identifier is found:

:py:mod:

Reference a module; a dotted name may be used. This should also be used for package names.

:py:func:

Reference a Python function; dotted names may be used. The role text needs not include trailing parentheses to enhance readability; they will be added automatically by Sphinx if the *add_function_parentheses* config value is True (the default).

:py:data:

Reference a module-level variable.

:py:const:

Reference a "defined" constant. This may be a Python variable that is not intended to be changed.

:py:class:

Reference a class; a dotted name may be used.

:py:meth:

Reference a method of an object. The role text can include the type name and the method name; if it occurs within the description of a type, the type name can be omitted. A dotted name may be used.

:py:attr:

Reference a data attribute of an object.

Note: The role is also able to refer to property.

:py:exc:

Reference an exception. A dotted name may be used.

:py:obj:

Reference an object of unspecified type. Useful e.g. as the *default_role*.

New in version 0.4.

The name enclosed in this markup can include a module name and/or a class name. For example, :py:func:`filter` could refer to a function named filter in the current module, or the built-in function of that name. In contrast, :py:func:`foo.filter` clearly refers to the filter function in the foo module.

Normally, names in these roles are searched first without any further qualification, then with the current module name prepended, then with the current module and class name (if any) prepended. If you prefix the name with a dot, this order is reversed. For example, in the documentation of Python's codecs²⁷⁵ module, :py:func:`open` always refers to the built-in function, while :py:func:`.open` refers to codecs.open()²⁷⁶.

A similar heuristic is used to determine whether the name is an attribute of the currently documented class.

Also, if the name is prefixed with a dot, and no exact match is found, the target is taken as a suffix and all object names with that suffix are searched. For example, :py:meth:`.TarFile.close` references the tarfile.TarFile. close() function, even if the current module is not tarfile. Since this can get ambiguous, if there is more than one possible match, you will get a warning from Sphinx.

Note that you can combine the ~ and . prefixes: :py:meth:`~.TarFile.close` will reference the tarfile. TarFile.close() method, but the visible link caption will only be close().

The reStructuredText Domain

New in version 1.0.

The reStructuredText domain (name rst) provides the following directives:

.. rst:directive:: name

Describes a reST directive. The *name* can be a single directive name or actual directive syntax (.. prefix and :: suffix) with arguments that will be rendered differently. For example:

```
.. rst:directive:: foo

Foo description.
.. rst:directive:: .. bar:: baz

Bar description.
```

will be rendered as:

.. foo::

Foo description.

.. bar:: baz

Bar description.

.. rst:directive:option:: name

Describes an option for reST directive. The *name* can be a single option name or option name with arguments which separated with colon (:). For example:

```
.. rst:directive:: toctree
    .. rst:directive:option:: caption: caption of ToC
    .. rst:directive:option:: glob
```

will be rendered as:

.. toctree::

²⁷⁵ https://docs.python.org/3/library/codecs.html#module-codecs

²⁷⁶ https://docs.python.org/3/library/codecs.html#codecs.open

```
:caption: caption of ToC
:glob:
```

options

:type: description of argument (text)

Describe the type of option value.

For example:

```
.. rst:directive:: toctree

.. rst:directive:option:: maxdepth
    :type: integer or no value
```

New in version 2.1.

.. rst:role:: name

Describes a reST role. For example:

```
.. rst:role:: foo

Foo description.
```

will be rendered as:

:foo:

Foo description.

These roles are provided to refer to the described objects:

:rst:dir:
:rst:role:

More domains

There are several third-party domains available as extensions, including:

- Ada²⁷⁷
- Chapel²⁷⁸
- CoffeeScript²⁷⁹
- Common Lisp²⁸⁰
- dqn²⁸¹
- Erlang²⁸²

²⁷⁷ https://pypi.org/project/sphinxcontrib-adadomain/

https://pypi.org/project/sphinxcontrib-chapeldomain/

https://pypi.org/project/sphinxcontrib-coffee/

²⁸⁰ https://pypi.org/project/sphinxcontrib-cldomain/

²⁸¹ https://pypi.org/project/sphinxcontrib-dqndomain/

²⁸² https://pypi.org/project/sphinxcontrib-erlangdomain/

- Go²⁸³
- HTTP²⁸⁴
- Jinja²⁸⁵
- Lasso²⁸⁶
- MATLAB²⁸⁷
- Operation²⁸⁸
- PHP²⁸⁹
- Ruby²⁹⁰
- Scala²⁹¹

4.7 Extensions

Since many projects will need special features in their documentation, Sphinx allows adding "extensions" to the build process, each of which can modify almost any aspect of document processing.

This chapter describes the extensions bundled with Sphinx. For the API documentation on writing your own extension, refer to *Sphinx Extensions API*.

Built-in extensions

These extensions are built in and can be activated by respective entries in the extensions configuration value:

sphinx.ext.autodoc - Include documentation from docstrings

This extension can import the modules you are documenting, and pull in documentation from docstrings in a semiautomatic way.

Note: For Sphinx (actually, the Python interpreter that executes Sphinx) to find your module, it must be importable. That means that the module or the package must be in one of the directories on $sys.path^{292}$ – adapt your $sys.path^{293}$ in the configuration file accordingly.

Warning: autodoc **imports** the modules to be documented. If any modules have side effects on import, these will be executed by autodoc when sphinx-build is run.

²⁸³ https://pypi.org/project/sphinxcontrib-golangdomain/

²⁸⁴ https://pypi.org/project/sphinxcontrib-httpdomain/

²⁸⁵ https://pypi.org/project/sphinxcontrib-jinjadomain/

²⁸⁶ https://pypi.org/project/sphinxcontrib-lassodomain/

²⁸⁷ https://pypi.org/project/sphinxcontrib-matlabdomain/

²⁸⁸ https://pypi.org/project/sphinxcontrib-operationdomain/

²⁸⁹ https://pypi.org/project/sphinxcontrib-phpdomain/

²⁹⁰ https://pypi.org/project/sphinxcontrib-rubydomain/

²⁹¹ https://pypi.org/project/sphinxcontrib-scaladomain/

²⁹² https://docs.python.org/3/library/sys.html#sys.path

²⁹³ https://docs.python.org/3/library/sys.html#sys.path

```
If you document scripts (as opposed to library modules), make sure their main routine is protected by a if __name__ == '__main__' condition.
```

For this to work, the docstrings must of course be written in correct reStructuredText. You can then use all of the usual Sphinx markup in the docstrings, and it will end up correctly in the documentation. Together with hand-written documentation, this technique eases the pain of having to maintain two locations for documentation, while at the same time avoiding auto-generated-looking pure API documentation.

If you prefer NumPy²⁹⁴ or Google²⁹⁵ style docstrings over reStructuredText, you can also enable the *napoleon* extension. *napoleon* is a preprocessor that converts your docstrings to correct reStructuredText before autodoc processes them.

Directives

autodoc provides several directives that are versions of the usual *py:module*, *py:class* and so forth. On parsing time, they import the corresponding module and extract the docstring of the given objects, inserting them into the page source under a suitable *py:module*, *py:class* etc. directive.

Note: Just as *py:class* respects the current *py:module*, *autoclass* will also do so. Likewise, *automethod* will respect the current *py:class*.

- .. automodule::
- .. autoclass::
- .. autoexception::

Document a module, class or exception. All three directives will by default only insert the docstring of the object itself:

```
.. autoclass:: Noodle
```

will produce source like this:

```
.. class:: Noodle

Noodle's docstring.
```

The "auto" directives can also contain content of their own, it will be inserted into the resulting non-auto directive source after the docstring (but before any automatic member documentation).

Therefore, you can also mix automatic and non-automatic member documentation, like so:

```
.. autoclass:: Noodle
  :members: eat, slurp

.. method:: boil(time=10)

Boil the noodle *time* minutes.
```

²⁹⁴ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

²⁹⁵ https://github.com/google/styleguide/blob/gh-pages/pyguide.md#38-comments-and-docstrings

Options

:members: (no value or comma separated list)

If set, autodoc will generate document for the members of the target module, class or exception.

For example:

```
.. automodule:: noodle :members:
```

will document all module members (recursively), and

```
.. autoclass:: Noodle :members:
```

will document all class member methods and properties.

By default, autodoc will not generate document for the members that are private, not having docstrings, inherited from super class, or special members.

For modules, __all__ will be respected when looking for members unless you give the ignore-module-all flag option. Without ignore-module-all, the order of the members will also be the order in __all__.

You can also give an explicit list of members; only these will then be documented:

```
.. autoclass:: Noodle
:members: eat, slurp
```

:undoc-members: (no value)

If set, autodoc will also generate document for the members not having docstrings:

```
.. automodule:: noodle
:members:
:undoc-members:
```

:private-members: (no value or comma separated list)

If set, autodoc will also generate document for the private members (that is, those named like _private or __private):

```
.. automodule:: noodle
  :members:
  :private-members:
```

It can also take an explicit list of member names to be documented as arguments:

```
.. automodule:: noodle
:members:
:private-members: _spicy, _garlickly
```

New in version 1.1.

Changed in version 3.2: The option can now take arguments.

:special-members: (no value or comma separated list)

If set, autodoc will also generate document for the special members (that is, those named like __special__):

```
.. autoclass:: my.Class
:members:
:special-members:
```

It can also take an explicit list of member names to be documented as arguments:

```
.. autoclass:: my.Class
:members:
:special-members: __init__, __name__
```

New in version 1.1.

Changed in version 1.2: The option can now take arguments

Options and advanced usage

• If you want to make the members option (or other options described below) the default, see autodoc_default_options.

Tip: You can use a negated form, 'no-flag', as an option of autodoc directive, to disable it temporarily. For example:

```
.. automodule:: foo 
:no-undoc-members:
```

Tip: You can use autodoc directive options to temporarily override or extend default options which takes list as an input. For example:

```
.. autoclass:: Noodle
:members: eat
:private-members: +_spicy, _garlickly
```

Changed in version 3.5: The default options can be overridden or extended temporarily.

autodoc considers a member private if its docstring contains :meta private: in its Info field lists. For example:

```
def my_function(my_arg, my_other_arg):
    """blah blah blah
    :meta private:
    """
```

New in version 3.0.

• autodoc considers a member public if its docstring contains :meta public: in its *Info field lists*, even if it starts with an underscore. For example:

```
def _my_function(my_arg, my_other_arg):
    """blah blah blah
    :meta public:
    """
```

New in version 3.1.

• autodoc considers a variable member does not have any default value if its docstring contains :meta hide-value: in its *Info field lists*. Example:

```
var1 = None #: :meta hide-value:
```

New in version 3.5.

• For classes and exceptions, members inherited from base classes will be left out when documenting all members, unless you give the inherited-members option, in addition to members:

```
.. autoclass:: Noodle
  :members:
  :inherited-members:
```

This can be combined with undoc-members to document all available members of the class or module.

It can take an ancestor class not to document inherited members from it. By default, members of object class are not documented. To show them all, give None to the option.

For example; If your class Foo is derived from list class and you don't want to document list. __len__(), you should specify a option :inherited-members: list to avoid special members of list class.

Another example; If your class Foo has __str__ special method and autodoc directive has both inherited-members and special-members, __str__ will be documented as in the past, but other special method that are not implemented in your class Foo.

Since v5.0, it can take a comma separated list of ancestor classes. It allows to suppress inherited members of several classes on the module at once by specifying the option to *automodule* directive.

Note: this will lead to markup errors if the inherited members come from a module whose docstrings are not reST formatted.

New in version 0.3.

Changed in version 3.0: It takes an ancestor class name as an argument.

Changed in version 5.0: It takes a comma separated list of ancestor class names.

• It's possible to override the signature for explicitly documented callable objects (functions, methods, classes) with the regular syntax that will override the signature gained from introspection:

```
.. autoclass:: Noodle(type)
.. automethod:: eat(persona)
```

This is useful if the signature from the method is hidden by a decorator.

New in version 0.4.

• The automodule, autoclass and autoexception directives also support a flag option called show-inheritance. When given, a list of base classes will be inserted just below the class signature (when used with automodule, this will be inserted for every class that is documented in the module).

New in version 0.4.

All autodoc directives support the no-index flag option that has the same effect as for standard py: function etc. directives: no index entries are generated for the documented object (and all autodocumented members).

New in version 0.4.

• automodule also recognizes the synopsis, platform and deprecated options that the standard py:module directive supports.

New in version 0.5.

• automodule and autoclass also has an member-order option that can be used to override the global value of autodoc_member_order for one directive.

New in version 0.6.

• The directives supporting member documentation also have a exclude-members option that can be used to exclude single member names from documentation, if all members are to be documented.

New in version 0.6.

• In an *automodule* directive with the members option set, only module members whose __module__ attribute is equal to the module name as given to automodule will be documented. This is to prevent documentation of imported classes or functions. Set the imported-members option if you want to prevent this behavior and document all available members. Note that attributes from imported modules will not be documented, because attribute documentation is discovered by parsing the source file of the current module.

New in version 1.2.

• Add a list of modules in the *autodoc_mock_imports* to prevent import errors to halt the building process when some external dependencies are not importable at build time.

New in version 1.3.

• As a hint to autodoc extension, you can put a :: separator in between module name and object name to let autodoc know the correct module name if it is ambiguous.

```
.. autoclass:: module.name::Noodle
```

 autoclass also recognizes the class-doc-from option that can be used to override the global value of autoclass_content.

New in version 4.1.

- .. autofunction::
- .. autodecorator::
- .. autodata::
- .. automethod::
- .. autoattribute::
- .. autoproperty::

These work exactly like autoclass etc., but do not offer the options used for automatic member documentation.

autodata and autoattribute support the annotation option. The option controls how the value of variable is shown. If specified without arguments, only the name of the variable will be printed, and its value is not shown:

```
.. autodata:: CD_DRIVE :annotation:
```

If the option specified with arguments, it is printed after the name as a value of the variable:

```
.. autodata:: CD_DRIVE
:annotation: = your CD device name
```

By default, without annotation option, Sphinx tries to obtain the value of the variable and print it after the name.

The no-value option can be used instead of a blank annotation to show the type hint but not the value:

```
.. autodata:: CD_DRIVE :no-value:
```

If both the annotation and no-value options are used, no-value has no effect.

For module data members and class attributes, documentation can either be put into a comment with special formatting (using a #: to start the comment instead of just #), or in a docstring *after* the definition. Comments need to be either on a line of their own *before* the definition, or immediately after the assignment *on the same line*. The latter form is restricted to one line only.

This means that in the following class definition, all attributes can be autodocumented:

```
class Foo:
    """Docstring for class Foo."""

#: Doc comment for class attribute Foo.bar.
#: It can have multiple lines.
bar = 1

flox = 1.5  #: Doc comment for Foo.flox. One line only.

baz = 2
    """Docstring for class attribute Foo.baz."""

def __init__(self):
    #: Doc comment for instance attribute qux.
    self.qux = 3

    self.spam = 4
    """Docstring for instance attribute spam."""
```

Changed in version 0.6: autodata and autoattribute can now extract docstrings.

Changed in version 1.1: Comment docs are now allowed on the same line after an assignment.

Changed in version 1.2: autodata and autoattribute have an annotation option.

Changed in version 2.0: autodecorator added.

Changed in version 2.1: autoproperty added.

Changed in version 3.4: autodata and autoattribute now have a no-value option.

Note: If you document decorated functions or methods, keep in mind that autodoc retrieves its docstrings by importing the module and inspecting the __doc__ attribute of the given function or method. That means that if a decorator replaces the decorated function with another, it must copy the original __doc__ to the new function.

Configuration

There are also config values that you can set:

autoclass_content

This value selects what content will be inserted into the main body of an *autoclass* directive. The possible values are:

"class"

Only the class' docstring is inserted. This is the default. You can still document __init__ as a separate method using automethod or the members option to autoclass.

"both"

Both the class' and the __init__ method's docstring are concatenated and inserted.

"init"

Only the __init__ method's docstring is inserted.

New in version 0.3.

If the class has no __init__ method or if the __init__ method's docstring is empty, but the class has a __new__ method's docstring, it is used instead.

New in version 1.4.

autodoc_class_signature

This value selects how the signature will be displayed for the class defined by *autoclass* directive. The possible values are:

"mixed"

Display the signature with the class name.

"separated"

Display the signature as a method.

The default is "mixed".

New in version 4.1.

autodoc_member_order

This value selects if automatically documented members are sorted alphabetical (value 'alphabetical'), by member type (value 'groupwise') or by source order (value 'bysource'). The default is alphabetical.

Note that for source order, the module must be a Python module with the source code available.

New in version 0.6.

Changed in version 1.0: Support for 'bysource'.

autodoc_default_flags

This value is a list of autodoc directive flags that should be automatically applied to all autodoc directives. The supported flags are 'members', 'undoc-members', 'private-members', 'special-members', 'inherited-members', 'show-inheritance', 'ignore-module-all' and 'exclude-members'.

New in version 1.0.

Deprecated since version 1.8: Integrated into autodoc_default_options.

autodoc_default_options

The default options for autodoc directives. They are applied to all autodoc directives automatically. It must be a dictionary which maps option names to the values. For example:

```
autodoc_default_options = {
    'members': 'var1, var2',
    'member-order': 'bysource',
    'special-members': '__init__',
    'undoc-members': True,
    'exclude-members': '__weakref__'
}
```

Setting None or True to the value is equivalent to giving only the option name to the directives.

```
The supported options are 'members', 'member-order', 'undoc-members', 'private-members', 'special-members', 'inherited-members', 'show-inheritance', 'ignore-module-all', 'imported-members', 'exclude-members', 'class-doc-from' and 'no-value'.
```

New in version 1.8.

Changed in version 2.0: Accepts True as a value.

Changed in version 2.1: Added 'imported-members'.

Changed in version 4.1: Added 'class-doc-from'.

Changed in version 4.5: Added 'no-value'.

autodoc_docstring_signature

Functions imported from C modules cannot be introspected, and therefore the signature for such functions cannot be automatically determined. However, it is an often-used convention to put the signature into the first line of the function's docstring.

If this boolean value is set to True (which is the default), autodoc will look at the first line of the docstring for functions and methods, and if it looks like a signature, use the line as the signature and remove it from the docstring content.

autodoc will continue to look for multiple signature lines, stopping at the first line that does not look like a signature. This is useful for declaring overloaded function signatures.

New in version 1.1.

Changed in version 3.1: Support overloaded signatures

Changed in version 4.0: Overloaded signatures do not need to be separated by a backslash

autodoc_mock_imports

This value contains a list of modules to be mocked up. This is useful when some external dependencies are not met at build time and break the building process. You may only specify the root package of the dependencies themselves and omit the sub-modules:

```
autodoc_mock_imports = ["django"]
```

Will mock all imports under the django package.

New in version 1.3.

Changed in version 1.6: This config value only requires to declare the top-level modules that should be mocked.

autodoc_typehints

This value controls how to represent typehints. The setting takes the following values:

- 'signature' Show typehints in the signature (default)
- 'description' Show typehints as content of the function or method The typehints of overloaded functions or methods will still be represented in the signature.

- 'none' Do not show typehints
- 'both' Show typehints in the signature and as content of the function or method

Overloaded functions or methods will not have typehints included in the description because it is impossible to accurately represent all possible overloads as a list of parameters.

New in version 2.1.

New in version 3.0: New option 'description' is added.

New in version 4.1: New option 'both' is added.

autodoc_typehints_description_target

This value controls whether the types of undocumented parameters and return values are documented when autodoc_typehints is set to description.

The default value is "all", meaning that types are documented for all parameters and return values, whether they are documented or not.

When set to "documented", types will only be documented for a parameter or a return value that is already documented by the docstring.

With "documented_params", parameter types will only be annotated if the parameter is documented in the docstring. The return type is always annotated (except if it is None).

New in version 4.0.

New in version 5.0: New option 'documented_params' is added.

autodoc_type_aliases

A dictionary for users defined type aliases²⁹⁶ that maps a type name to the full-qualified object name. It is used to keep type aliases not evaluated in the document. Defaults to empty ({}).

The type aliases are only available if your program enables **Postponed Evaluation of Annotations** (**PEP 563**)²⁹⁷ feature via from __future__ import annotations.

For example, there is code using a type alias:

```
from __future__ import annotations
AliasType = Union[List[Dict[Tuple[int, str], Set[int]]], Tuple[str, List[str]]]
def f() -> AliasType:
    ...
```

If autodoc_type_aliases is not set, autodoc will generate internal mark-up from this code as following:

```
.. py:function:: f() -> Union[List[Dict[Tuple[int, str], Set[int]]], Tuple[str,__
List[str]]]
...
```

If you set autodoc_type_aliases as {'AliasType': 'your.module.AliasType'}, it generates the following document internally:

```
.. py:function:: f() -> your.module.AliasType:
...
```

New in version 3.3.

autodoc_typehints_format

This value controls the format of typehints. The setting takes the following values:

- 'fully-qualified' Show the module name and its name of typehints
- 'short' Suppress the leading module names of the typehints (ex. io.StringIO -> StringIO) (default)

New in version 4.4.

Changed in version 5.0: The default setting was changed to 'short'

autodoc_preserve_defaults

If True, the default argument values of functions will be not evaluated on generating document. It preserves them as is in the source code.

New in version 4.0: Added as an experimental feature. This will be integrated into autodoc core in the future.

autodoc_warningiserror

This value controls the behavior of *sphinx-build -W* during importing modules. If False is given, autodoc forcedly suppresses the error if the imported module emits warnings. By default, True.

autodoc_inherit_docstrings

This value controls the docstrings inheritance. If set to True the docstring for classes or methods, if not explicitly set, is inherited from parents.

The default is True.

New in version 1.7.

suppress_warnings

autodoc supports to suppress warning messages via *suppress_warnings*. It allows following warnings types in addition:

- autodoc
- autodoc.import_object

Docstring preprocessing

autodoc provides the following additional events:

autodoc-process-docstring(app, what, name, obj, options, lines)

New in version 0.4.

Emitted when autodoc has read and processed a docstring. *lines* is a list of strings – the lines of the processed docstring – that the event handler can modify **in place** to change what Sphinx puts into the output.

Parameters

- app the Sphinx application object
- what the type of the object which the docstring belongs to (one of "module", "class", "exception", "function", "method", "attribute")
- name the fully qualified name of the object
- **obj** the object itself

 $^{^{296}\} https://mypy.readthedocs.io/en/latest/kinds_of_types.html\#type-aliases$

²⁹⁷ https://peps.python.org/pep-0563/

- **options** the options given to the directive: an object with attributes <code>inherited_members</code>, <code>undoc_members</code>, <code>show_inheritance</code> and <code>no-index</code> that are true if the flag option of same name was given to the auto directive
- lines the lines of the docstring, see above

autodoc-before-process-signature(app, obj, bound_method)

New in version 2.4.

Emitted before autodoc formats a signature for an object. The event handler can modify an object to change its signature.

Parameters

- app the Sphinx application object
- **obj** the object itself
- bound_method a boolean indicates an object is bound method or not

autodoc-process-signature(app, what, name, obj, options, signature, return_annotation)

New in version 0.5.

Emitted when autodoc has formatted a signature for an object. The event handler can return a new tuple (signature, return_annotation) to change what Sphinx puts into the output.

Parameters

- app the Sphinx application object
- what the type of the object which the docstring belongs to (one of "module", "class", "exception", "function", "method", "attribute")
- name the fully qualified name of the object
- **obi** the object itself
- **options** the options given to the directive: an object with attributes **inherited_members**, undoc_members, show_inheritance and no-index that are true if the flag option of same name was given to the auto directive
- **signature** function signature, as a string of the form "(parameter_1, parameter_2)", or None if introspection didn't succeed and signature wasn't specified in the directive.
- return_annotation function return annotation as a string of the form " -> annotation", or None if there is no return annotation

The *sphinx.ext.autodoc* module provides factory functions for commonly needed docstring processing in event *autodoc-process-docstring*:

```
sphinx.ext.autodoc.cut_lines(pre: int^{298}, post: int^{299} = 0, what: str^{300} \mid None^{301} = None) \rightarrow Callable<sup>302</sup>
```

Return a listener that removes the first *pre* and last *post* lines of every docstring. If *what* is a sequence of strings, only docstrings of a type in *what* will be processed.

Use like this (e.g. in the setup() function of conf.py):

```
from sphinx.ext.autodoc import cut_lines
app.connect('autodoc-process-docstring', cut_lines(4, what=['module']))
```

This can (and should) be used in place of automodule_skip_lines.

```
sphinx.ext.autodoc.between(marker: str^{303}, what: Sequence[str^{304}] | None^{305} = None, keepempty: bool^{306} = False, exclude: bool^{307} = False) \rightarrow Callable
```

Return a listener that either keeps, or if *exclude* is True excludes, lines between lines that match the *marker* regular expression. If no line matches, the resulting docstring would be empty, so no change will be made unless *keepempty* is true.

If what is a sequence of strings, only docstrings of a type in what will be processed.

autodoc-process-bases(app, name, obj, options, bases)

Emitted when autodoc has read and processed a class to determine the base-classes. *bases* is a list of classes that the event handler can modify **in place** to change what Sphinx puts into the output. It's emitted only if show-inheritance option given.

Parameters

- app the Sphinx application object
- name the fully qualified name of the object
- **obj** the object itself
- options the options given to the class directive
- bases the list of base classes signature. see above.

New in version 4.1.

Changed in version 4.3: bases can contain a string as a base class name. It will be processed as reST mark-up'ed text.

Skipping members

autodoc allows the user to define a custom method for determining whether a member should be included in the documentation by using the following event:

```
autodoc-skip-member(app, what, name, obj, skip, options)
```

New in version 0.5.

Emitted when autodoc has to decide whether a member should be included in the documentation. The member is excluded if a handler returns True. It is included if the handler returns False.

If more than one enabled extension handles the autodoc-skip-member event, autodoc will use the first non-None value returned by a handler. Handlers should return None to fall back to the skipping behavior of autodoc and other enabled extensions.

Parameters

- app the Sphinx application object
- what the type of the object which the docstring belongs to (one of "module", "class", "exception", "function", "method", "attribute")

 $^{^{298}\} https://docs.python.org/3/library/functions.html\#int$

²⁹⁹ https://docs.python.org/3/library/functions.html#int

³⁰⁰ https://docs.python.org/3/library/stdtypes.html#str

³⁰³ https://docs.python.org/3/library/stdtypes.html#str

³⁰⁴ https://docs.python.org/3/library/stdtypes.html#str

³⁰⁵ https://docs.python.org/3/library/constants.html#None

³⁰⁶ https://docs.python.org/3/library/functions.html#bool

³⁰⁷ https://docs.python.org/3/library/functions.html#bool

- name the fully qualified name of the object
- **obj** the object itself
- **skip** a boolean indicating if autodoc will skip this member if the user handler does not override the decision
- **options** the options given to the directive: an object with attributes inherited_members, undoc_members, show_inheritance and no-index that are true if the flag option of same name was given to the auto directive

sphinx.ext.autosectionlabel - Allow reference sections using its title

New in version 1.4.

This extension allows you to refer sections its title. This affects to the reference role (ref).

For example:

```
A Plain Title
-----
This is the text of the section.

It refers to the section title, see :ref:`A Plain Title`.
```

Internally, this extension generates the labels for each section. If same section names are used in whole of document, any one is used for a target by default. The autosectionlabel_prefix_document configuration variable can be used to make headings which appear multiple times but in different documents unique.

Configuration

autosectionlabel_prefix_document

True to prefix each section label with the name of the document it is in, followed by a colon. For example, index:Introduction for a section called Introduction that appears in document index.rst. Useful for avoiding ambiguity when the same section heading appears in different documents.

autosectionlabel_maxdepth

If set, autosectionlabel chooses the sections for labeling by its depth. For example, when set 1 to autosectionlabel_maxdepth, labels are generated only for top level sections, and deeper sections are not labeled. It defaults to None (disabled).

Debugging

The WARNING: undefined label indicates that your reference in ref is mis-spelled. Invoking **sphinx-build** with -vv (see -v³⁰⁸) will print all section names and the labels that have been generated for them. This output can help finding the right reference label.

³⁰⁸ https://docs.python.org/3/using/cmdline.html#cmdoption-v

sphinx.ext.autosummary - Generate autodoc summaries

New in version 0.6.

This extension generates function/method/attribute summary lists, similar to those output e.g. by Epydoc and other API doc generation tools. This is especially useful when your docstrings are long and detailed, and putting each one of them on a separate page makes them easier to read.

The *sphinx.ext.autosummary* extension does this in two parts:

- 1. There is an *autosummary* directive for generating summary listings that contain links to the documented items, and short summary blurbs extracted from their docstrings.
- 2. A *autosummary* directive also generates short "stub" files for the entries listed in its content. These files by default contain only the corresponding *sphinx.ext.autodoc* directive, but can be customized with templates.

The **sphinx-autogen** script is also able to generate "stub" files from command line.

.. autosummary::

Insert a table that contains links to documented items, and a short summary blurb (the first sentence of the docstring) for each of them.

The *autosummary* directive can also optionally serve as a *toctree* entry for the included items. Optionally, stub .rst files for these items can also be automatically generated when *autosummary_generate* is *True*.

For example,

```
.. currentmodule:: sphinx
.. autosummary::
environment.BuildEnvironment
util.relative_uri
```

produces a table like this:

| environment.BuildEnvironment(app) | The environment in which the ReST files are translated. |
|-----------------------------------|---|
| util.relative_uri(base, to) | Return a relative URL from base to to. |

Autosummary preprocesses the docstrings and signatures with the same autodoc-process-docstring and autodoc-process-signature hooks as autodoc.

Options

• If you want the autosummary table to also serve as a toctree entry, use the toctree option, for example:

```
.. autosummary::
:toctree: DIRNAME

sphinx.environment.BuildEnvironment
sphinx.util.relative_uri
```

The toctree option also signals to the **sphinx-autogen** script that stub pages should be generated for the entries listed in this directive. The option accepts a directory name as an argument; **sphinx-autogen** will by default place its output in this directory. If no argument is given, output is placed in the same directory as the file that contains the directive.

You can also use caption option to give a caption to the toctree.

New in version 3.1: caption option added.

• If you don't want the *autosummary* to show function signatures in the listing, include the nosignatures option:

```
.. autosummary::
    :nosignatures:
    sphinx.environment.BuildEnvironment
    sphinx.util.relative_uri
```

• You can specify a custom template with the template option. For example,

```
.. autosummary::
    :template: mytemplate.rst
    sphinx.environment.BuildEnvironment
```

would use the template mytemplate.rst in your templates_path to generate the pages for all entries listed. See *Customizing templates* below.

New in version 1.0.

• You can specify the recursive option to generate documents for modules and sub-packages recursively. It defaults to disabled. For example,

```
.. autosummary::
    :recursive:
    sphinx.environment.BuildEnvironment
```

New in version 3.1.

sphinx-autogen - generate autodoc stub pages

The **sphinx-autogen** script can be used to conveniently generate stub documentation pages for items included in *autosummary* listings.

For example, the command

```
$ sphinx-autogen -o generated *.rst
```

will read all *autosummary* tables in the *.rst files that have the :toctree: option set, and output corresponding stub pages in directory generated for all documented items. The generated pages by default contain text of the form:

If the -o option is not given, the script will place the output files in the directories specified in the :toctree: options.

For more information, refer to the sphinx-autogen documentation

Generating stub pages automatically

If you do not want to create stub pages with **sphinx-autogen**, you can also use these config values:

autosummary_context

A dictionary of values to pass into the template engine's context for autosummary stubs files.

New in version 3.1.

autosummary_generate

Boolean indicating whether to scan all found documents for autosummary directives, and to generate stub pages for each. It is enabled by default.

Can also be a list of documents for which stub pages should be generated.

The new files will be placed in the directories specified in the :toctree: options of the directives.

Changed in version 2.3: Emits autodoc-skip-member event as autodoc does.

Changed in version 4.0: Enabled by default.

autosummary_generate_overwrite

If true, autosummary overwrites existing files by generated stub pages. Defaults to true (enabled).

New in version 3.0.

autosummary_mock_imports

This value contains a list of modules to be mocked up. See autodoc_mock_imports for more details. It defaults to autodoc_mock_imports.

New in version 2.0.

autosummary_imported_members

A boolean flag indicating whether to document classes and functions imported in modules. Default is False

New in version 2.1.

Changed in version 4.4: If autosummary_ignore_module_all is False, this configuration value is ignored for members listed in __all__.

autosummary_ignore_module_all

If False and a module has the __all__ attribute set, autosummary documents every member listed in __all__ and no others. Default is True

Note that if an imported member is listed in __all__, it will be documented regardless of the value of autosummary_imported_members. To match the behaviour of from module import *, set autosummary_ignore_module_all to False and autosummary_imported_members to True.

New in version 4.4.

autosummary_filename_map

A dict mapping object names to filenames. This is necessary to avoid filename conflicts where multiple objects have names that are indistinguishable when case is ignored, on file systems where filenames are case-insensitive.

New in version 3.2.

Customizing templates

New in version 1.0.

You can customize the stub page templates, in a similar way as the HTML Jinja templates, see *Templating*. (*TemplateBridge* is not supported.)

Note: If you find yourself spending much time tailoring the stub templates, this may indicate that it's a better idea to write custom narrative documentation instead.

Autosummary uses the following Jinja template files:

- autosummary/base.rst fallback template
- autosummary/module.rst template for modules
- autosummary/class.rst template for classes
- autosummary/function.rst template for functions
- autosummary/attribute.rst template for class attributes
- autosummary/method.rst template for class methods

The following variables are available in the templates:

name

Name of the documented object, excluding the module and class parts.

objname

Name of the documented object, excluding the module parts.

fullname

Full name of the documented object, including module and class parts.

objtype

```
Type of the documented object, one of "module", "function", "class", "method", "attribute", "data", "object", "exception", "newvarattribute", "newtypedata", "property".
```

module

Name of the module the documented object belongs to.

class

Name of the class the documented object belongs to. Only available for methods and attributes.

underline

A string containing len(full_name) * '='. Use the underline filter instead.

members

List containing names of all members of the module or class. Only available for modules and classes.

inherited_members

List containing names of all inherited members of class. Only available for classes.

New in version 1.8.0.

functions

List containing names of "public" functions in the module. Here, "public" means that the name does not start with an underscore. Only available for modules.

classes

List containing names of "public" classes in the module. Only available for modules.

exceptions

List containing names of "public" exceptions in the module. Only available for modules.

methods

List containing names of "public" methods in the class. Only available for classes.

attributes

List containing names of "public" attributes in the class/module. Only available for classes and modules.

Changed in version 3.1: Attributes of modules are supported.

modules

List containing names of "public" modules in the package. Only available for modules that are packages and the recursive option is on.

New in version 3.1.

Additionally, the following filters are available

escape(s)

Escape any special characters in the text to be used in formatting RST contexts. For instance, this prevents asterisks making things bold. This replaces the builtin Jinja escape filter³⁰⁹ that does html-escaping.

underline(s, line='=')

Add a title underline to a piece of text.

For instance, {{ fullname | escape | underline }} should be used to produce the title of a page.

Note: You can use the *autosummary* directive in the stub pages. Stub pages are generated also based on these directives.

sphinx.ext.coverage - Collect doc coverage stats

This extension features one additional builder, the CoverageBuilder.

class sphinx.ext.coverage.CoverageBuilder

To use this builder, activate the coverage extension in your configuration file and give -M coverage on the command line.

Todo: Write this section.

Several configuration values can be used to specify what the builder should check:

coverage_ignore_modules

coverage_ignore_functions

coverage_ignore_classes

³⁰⁹ https://jinja.palletsprojects.com/en/3.0.x/templates/#jinja-filters.escape

coverage_ignore_pyobjects

List of Python regular expressions³¹⁰.

If any of these regular expressions matches any part of the full import path of a Python object, that Python object is excluded from the documentation coverage report.

New in version 2.1.

coverage_c_path

coverage_c_regexes

coverage_ignore_c_items

coverage_write_headline

Set to False to not write headlines.

New in version 1.1.

coverage_skip_undoc_in_source

Skip objects that are not documented in the source with a docstring. False by default.

New in version 1.1.

coverage_show_missing_items

Print objects that are missing to standard output also. False by default.

New in version 3.1.

coverage_statistics_to_report

Print a tabular report of the coverage statistics to the coverage report. True by default.

Example output:

| + | + | ++ |
|--|-----------------------|--------------|
| Module | | Undocumented |
| +===================================== | +======= 100 00% | |
| package.foo_module | 100.00% | |
| · | + 83.33% | |
| + | • | |
| | 1 | ' |

New in version 7.2.

coverage_statistics_to_stdout

Print a tabular report of the coverage statistics to standard output. False by default.

Example output:

| Module Coverage Undocumented |
|----------------------------------|
| package.foo_module |
| package.bar_module |

New in version 7.2.

³¹⁰ https://docs.python.org/library/re

sphinx.ext.doctest - Test snippets in the documentation

It is often helpful to include snippets of code in your documentation and demonstrate the results of executing them. But it is important to ensure that the documentation stays up-to-date with the code.

This extension allows you to test such code snippets in the documentation in a natural way. If you mark the code blocks as shown here, the doctest builder will collect them and run them as doctest tests.

Within each document, you can assign each snippet to a group. Each group consists of:

- zero or more *setup code* blocks (e.g. importing the module to test)
- one or more test blocks

When building the docs with the doctest builder, groups are collected for each document and run one after the other, first executing setup code blocks, then the test blocks in the order they appear in the file.

There are two kinds of test blocks:

- *doctest-style* blocks mimic interactive sessions by interleaving Python code (including the interpreter prompt) and output.
- code-output-style blocks consist of an ordinary piece of Python code, and optionally, a piece of output for that
 code.

Directives

The *group* argument below is interpreted as follows: if it is empty, the block is assigned to the group named default. If it is *, the block is assigned to all groups (including the default group). Otherwise, it must be a comma-separated list of group names.

.. testsetup:: [group]

A setup code block. This code is not shown in the output for other builders, but executed before the doctests of the group(s) it belongs to.

.. testcleanup:: [group]

A cleanup code block. This code is not shown in the output for other builders, but executed after the doctests of the group(s) it belongs to.

New in version 1.1.

.. doctest:: [group]

A doctest-style code block. You can use standard doctest³¹¹ flags for controlling how actual output is compared with what you give as output. The default set of flags is specified by the *doctest_default_flags* configuration variable.

This directive supports five options:

- hide, a flag option, hides the doctest block in other builders. By default it is shown as a highlighted doctest block.
- options, a string option, can be used to give a comma-separated list of doctest flags that apply to each example in the tests. (You still can give explicit flags per example, with doctest comments, but they will show up in other builders too.)
- pyversion, a string option, can be used to specify the required Python version for the example to be tested. For instance, in the following case the example will be tested only for Python versions greater than 3.10:

```
.. doctest::
   :pyversion: > 3.10
```

The following operands are supported:

- ∼=: Compatible release clause
- ==: Version matching clause
- !=: Version exclusion clause
- <=, >=: Inclusive ordered comparison clause
- <, >: Exclusive ordered comparison clause
- ===: Arbitrary equality clause.

pyversion option is followed PEP-440: Version Specifiers³¹².

New in version 1.6.

Changed in version 1.7: Supported PEP-440 operands and notations

• trim-doctest-flags and no-trim-doctest-flags, a flag option, doctest flags (comments looking like # doctest: FLAG, ...) at the ends of lines and <BLANKLINE> markers are removed (or not removed) individually. Default is trim-doctest-flags.

Note that like with standard doctests, you have to use <BLANKLINE> to signal a blank line in the expected output. The <BLANKLINE> is removed when building presentation output (HTML, LaTeX etc.).

Also, you can give inline doctest options, like in doctest:

```
>>> datetime.date.now()  # doctest: +SKIP
datetime.date(2008, 1, 1)
```

They will be respected when the test is run, but stripped from presentation output.

.. testcode:: [group]

A code block for a code-output-style test.

This directive supports three options:

- hide, a flag option, hides the code block in other builders. By default it is shown as a highlighted code block.
- trim-doctest-flags and no-trim-doctest-flags, a flag option, doctest flags (comments looking like # doctest: FLAG, ...) at the ends of lines and <BLANKLINE> markers are removed (or not removed) individually. Default is trim-doctest-flags.

Note: Code in a testcode block is always executed all at once, no matter how many statements it contains. Therefore, output will *not* be generated for bare expressions – use print. Example:

³¹¹ https://docs.python.org/3/library/doctest.html#module-doctest

³¹² https://peps.python.org/pep-0440/#version-specifiers

Also, please be aware that since the doctest module does not support mixing regular output and an exception message in the same snippet, this applies to testcode/testoutput as well.

.. testoutput:: [group]

The corresponding output, or the exception message, for the last *testcode* block.

This directive supports four options:

- hide, a flag option, hides the output block in other builders. By default it is shown as a literal block without highlighting.
- options, a string option, can be used to give doctest flags (comma-separated) just like in normal doctest blocks.
- trim-doctest-flags and no-trim-doctest-flags, a flag option, doctest flags (comments looking like # doctest: FLAG, ...) at the ends of lines and <BLANKLINE> markers are removed (or not removed) individually. Default is trim-doctest-flags.

Example:

```
.. testcode::
    print('Output text.')
.. testoutput::
    :hide:
    :options: -ELLIPSIS, +NORMALIZE_WHITESPACE
    Output text.
```

The following is an example for the usage of the directives. The test via *doctest* and the test via *testcode* and *testoutput* are equivalent.

(continues on next page)

(continued from previous page)

```
This would output:

.. testoutput::

This parrot wouldn't voom if you put 3000 volts through it!
```

Skipping tests conditionally

skipif, a string option, can be used to skip directives conditionally. This may be useful e.g. when a different set of tests should be run depending on the environment (hardware, network/VPN, optional dependencies or different versions of dependencies). The skipif option is supported by all of the doctest directives. Below are typical use cases for skipif when used for different directives:

- testsetup and testcleanup
 - conditionally skip test setup and/or cleanup
 - customize setup/cleanup code per environment
- doctest
 - conditionally skip both a test and its output verification
- testcode
 - conditionally skip a test
 - customize test code per environment
- testoutput
 - conditionally skip output assertion for a skipped test
 - expect different output depending on the environment

The value of the skipif option is evaluated as a Python expression. If the result is a true value, the directive is omitted from the test run just as if it wasn't present in the file at all.

Instead of repeating an expression, the *doctest_global_setup* configuration option can be used to assign it to a variable which can then be used instead.

Here's an example which skips some tests if Pandas is not installed:

Listing 1: conf.py

```
extensions = ['sphinx.ext.doctest']
doctest_global_setup = '''
try:
   import pandas as pd
except ImportError:
   pd = None
'''
```

Listing 2: contents.rst

```
.. testsetup::
:skipif: pd is None

(continues on next page)
```

(continued from previous page)

```
data = pd.Series([42])
.. doctest::
    :skipif: pd is None

>>> data.iloc[0]
    42
.. testcode::
    :skipif: pd is None

print(data.iloc[-1])
.. testoutput::
    :skipif: pd is None

42
```

Configuration

The doctest extension uses the following configuration values:

doctest_default_flags

By default, these options are enabled:

- ELLIPSIS, allowing you to put ellipses in the expected output that match anything in the actual output;
- IGNORE_EXCEPTION_DETAIL, causing everything following the leftmost colon and any module information in the exception name to be ignored;
- DONT_ACCEPT_TRUE_FOR_1, rejecting "True" in the output where "1" is given the default behavior of accepting this substitution is a relic of pre-Python 2.2 times.

New in version 1.5.

doctest_show_successes

Defaults to True. Controls whether successes are reported.

For a project with many doctests, it may be useful to set this to False to only highlight failures.

New in version 7.2.

doctest_path

A list of directories that will be added to sys.path³¹³ when the doctest builder is used. (Make sure it contains absolute paths.)

doctest_global_setup

Python code that is treated like it were put in a testsetup directive for *every* file that is tested, and for every group. You can use this to e.g. import modules you will always need in your doctests.

New in version 0.6.

³¹³ https://docs.python.org/3/library/sys.html#sys.path

doctest_global_cleanup

Python code that is treated like it were put in a testcleanup directive for *every* file that is tested, and for every group. You can use this to e.g. remove any temporary files that the tests leave behind.

New in version 1.1.

doctest_test_doctest_blocks

If this is a nonempty string (the default is 'default'), standard reST doctest blocks will be tested too. They will be assigned to the group name given.

reST doctest blocks are simply doctests put into a paragraph of their own, like so:

```
Some documentation text.

>>> print(1)
1

Some more documentation text.
```

(Note that no special :: is used to introduce a doctest block; docutils recognizes them from the leading >>>. Also, no additional indentation is used, though it doesn't hurt.)

If this value is left at its default value, the above snippet is interpreted by the doctest builder exactly like the following:

```
Some documentation text.

.. doctest::
    >>> print(1)
    1

Some more documentation text.
```

This feature makes it easy for you to test doctests in docstrings included with the *autodoc* extension without marking them up with a special directive.

Note though that you can't have blank lines in reST doctest blocks. They will be interpreted as one block ending and another one starting. Also, removal of <BLANKLINE> and # doctest: options only works in doctest blocks, though you may set trim_doctest_flags to achieve that in all code blocks with Python console content.

sphinx.ext.duration - Measure durations of Sphinx processing

New in version 2.4.

This extension measures durations of Sphinx processing and show its result at end of the build. It is useful for inspecting what document is slowly built.

sphinx.ext.extlinks - Markup to shorten external links

Module author: Georg Brandl

New in version 1.0.

This extension is meant to help with the common pattern of having many external links that point to URLs on one and the same site, e.g. links to bug trackers, version control web interfaces, or simply subpages in other websites. It does so by providing aliases to base URLs, so that you only need to give the subpage name when creating a link.

Let's assume that you want to include many links to issues at the Sphinx tracker, at https://github.com/sphinx-doc/sphinx/issues/num. Typing this URL again and again is tedious, so you can use extlinks to avoid repeating yourself.

The extension adds a config value:

extlinks

This config value must be a dictionary of external sites, mapping unique short alias names to a *base URL* and a *caption*. For example, to create an alias for the above mentioned issues, you would add

Now, you can use the alias name as a new role, e.g. :issue:`123`. This then inserts a link to https://github.com/sphinx-doc/sphinx/issues/123. As you can see, the target given in the role is substituted in the *base URL* in the place of %s.

The link caption depends on the second item in the tuple, the *caption*:

- If *caption* is None, the link caption is the full URL.
- If *caption* is a string, then it must contain %s exactly once. In this case the link caption is *caption* with the partial URL substituted for %s in the above example, the link caption would be issue 123.

To produce a literal % in either base URL or caption, use %%:

You can also use the usual "explicit title" syntax supported by other roles that generate links, i.e. :issue: `this issue <123>`. In this case, the *caption* is not relevant.

Changed in version 4.0: Support to substitute by '%s' in the caption.

Note: Since links are generated from the role in the reading stage, they appear as ordinary links to e.g. the linkcheck builder.

extlinks_detect_hardcoded_links

If enabled, extlinks emits a warning if a hardcoded link is replaceable by an extlink, and suggests a replacement via warning. It defaults to False.

New in version 4.5.

sphinx.ext.githubpages - Publish HTML docs in GitHub Pages

New in version 1.4.

Changed in version 2.0: Support CNAME file

This extension creates .nojekyll file on generated HTML directory to publish the document on GitHub Pages.

It also creates a CNAME file for custom domains when html_baseurl set.

sphinx.ext.graphviz - Add Graphviz graphs

New in version 0.6.

This extension allows you to embed Graphviz³¹⁴ graphs in your documents.

It adds these directives:

.. graphviz::

Directive to embed graphviz code. The input code for dot is given as the content. For example:

```
.. graphviz::
    digraph foo {
        "bar" -> "baz";
    }
```

In HTML output, the code will be rendered to a PNG or SVG image (see *graphviz_output_format*). In LaTeX output, the code will be rendered to an embeddable PDF file.

You can also embed external dot files, by giving the file name as an argument to *graphviz* and no additional content:

```
.. graphviz:: external.dot
```

As for all file references in Sphinx, if the filename is absolute, it is taken as relative to the source directory.

Changed in version 1.1: Added support for external files.

options

:alt: alternate text (text)

The alternate text of the graph. By default, the graph code is used to the alternate text.

New in version 1.0.

:align: alignment of the graph (left, center or right)

The horizontal alignment of the graph.

New in version 1.5.

:caption: caption of the graph (text)

The caption of the graph.

New in version 1.1.

³¹⁴ https://graphviz.org/

:layout: layout type of the graph (text)

The layout of the graph (ex. dot, neato and so on). A path to the graphviz commands are also allowed. By default, *graphviz_dot* is used.

New in version 1.4.

Changed in version 2.2: Renamed from graphviz_dot

:name: label (text)

The label of the graph.

New in version 1.6.

:class: class names (a list of class names separated by spaces)

The class name of the graph.

New in version 2.4.

.. graph::

Directive for embedding a single undirected graph. The name is given as a directive argument, the contents of the graph are the directive content. This is a convenience directive to generate graph <name> { <content>}.

For example:

```
.. graph:: foo

"bar" -- "baz";
```

Note: The graph name is passed unchanged to Graphviz. If it contains non-alphanumeric characters (e.g. a dash), you will have to double-quote it.

options

Same as graphviz.

:alt: alternate text (text)

New in version 1.0.

:align: alignment of the graph (left, center or right)

New in version 1.5.

:caption: caption of the graph (text)

New in version 1.1.

:layout: layout type of the graph (text)

New in version 1.4.

Changed in version 2.2: Renamed from graphviz_dot

:name: label (text)

New in version 1.6.

:class: class names (a list of class names separated by spaces)

The class name of the graph.

New in version 2.4.

.. digraph::

Directive for embedding a single directed graph. The name is given as a directive argument, the contents of the graph are the directive content. This is a convenience directive to generate digraph <name> { <content> }.

For example:

```
.. digraph:: foo

"bar" -> "baz" -> "quux";
```

options

Same as graphviz.

```
:alt: alternate text (text)
```

New in version 1.0.

:align: alignment of the graph (left, center or right)

New in version 1.5.

:caption: caption of the graph (text)

New in version 1.1.

:layout: layout type of the graph (text)

New in version 1.4.

Changed in version 2.2: Renamed from graphviz_dot

:name: label (text)

New in version 1.6.

:class: class names (a list of class names separated by spaces)

The class name of the graph.

New in version 2.4.

There are also these config values:

graphviz_dot

The command name with which to invoke dot. The default is 'dot'; you may need to set this to a full path if dot is not in the executable search path.

Since this setting is not portable from system to system, it is normally not useful to set it in conf.py; rather, giving it on the **sphinx-build** command line via the -D option should be preferable, like this:

```
sphinx-build -M html -D graphviz_dot=C:\graphviz\bin\dot.exe . _build
```

graphviz_dot_args

Additional command-line arguments to give to dot, as a list. The default is an empty list. This is the right place to set global graph, node or edge attributes via dot's -G, -N and -E options.

graphviz_output_format

The output format for Graphviz when building HTML files. This must be either 'png' or 'svg'; the default is 'png'. If 'svg' is used, in order to make the URL links work properly, an appropriate target attribute must be set, such as "_top" and "_blank". For example, the link in the following graph should work in the svg output:

```
digraphviz::

    digraph example {
        a [label="sphinx", href="https://www.sphinx-doc.org/", target="_top"];
        b [label="other"];
        a -> b;
}
```

New in version 1.0: Previously, output always was PNG.

sphinx.ext.ifconfig - Include content based on configuration

This extension is quite simple, and features only one directive:

Warning: This directive is designed to control only content of document. It could not control sections, labels and so on.

.. ifconfig::

Include content of the directive only if the Python expression given as an argument is True, evaluated in the namespace of the project's configuration (that is, all registered variables from conf.py are available).

For example, one could write

```
.. ifconfig:: releaselevel in ('alpha', 'beta', 'rc')

This stuff is only included in the built docs for unstable versions.
```

To make a custom config value known to Sphinx, use add_config_value() in the setup function in conf.py, e.g.:

```
def setup(app):
    app.add_config_value('releaselevel', '', 'env')
```

The second argument is the default value, the third should always be 'env' for such values (it selects if Sphinx re-reads the documents if the value changes).

sphinx.ext.imgconverter - A reference image converter using Imagemagick

New in version 1.6.

This extension converts images in your document to appropriate format for builders. For example, it allows you to use SVG images with LaTeX builder. As a result, you don't mind what image format the builder supports.

By default the extension uses ImageMagick³¹⁵ to perform conversions, and will not work if ImageMagick is not installed.

Note: ImageMagick rasterizes a SVG image on conversion. As a result, the image becomes not scalable. To avoid that, please use other image converters like sphinxcontrib-svg2pdfconverter³¹⁶ (which uses Inkscape or rsvg-convert).

³¹⁵ https://www.imagemagick.org

³¹⁶ https://github.com/missinglinkelectronics/sphinxcontrib-svg2pdfconverter

Configuration

image_converter

A path to a conversion command. By default, the imgconverter finds the command from search paths.

On Unix platforms, the command **convert** is used by default.

On Windows, the command **magick** is used by default.

Changed in version 3.1: Use magick command by default on windows

image_converter_args

Additional command-line arguments to give to **convert**, as a list. The default is an empty list [].

On Windows, it defaults to ["convert"].

Changed in version 3.1: Use ["convert"] by default on Windows

sphinx.ext.inheritance_diagram - Include inheritance diagrams

New in version 0.6.

This extension allows you to include inheritance diagrams, rendered via the *Graphviz extension*.

It adds this directive:

.. inheritance-diagram::

This directive has one or more arguments, each giving a module or class name. Class names can be unqualified; in that case they are taken to exist in the currently described module (see *py:module*).

For each given class, and each class in each given module, the base classes are determined. Then, from all classes and their base classes, a graph is generated which is then rendered via the graphviz extension to a directed graph.

This directive supports an option called parts that, if given, must be an integer, advising the directive to keep that many dot-separated parts in the displayed names (from right to left). For example, parts=1 will only display class names, without the names of the modules that contain them.

Changed in version 2.0: The value of for parts can also be negative, indicating how many parts to drop from the left. For example, if all your class names start with lib., you can give :parts: -1 to remove that prefix from the displayed node names.

The directive also supports a private-bases flag option; if given, private base classes (those whose name starts with _) will be included.

You can use caption option to give a caption to the diagram.

Changed in version 1.1: Added private-bases option; previously, all bases were always included.

Changed in version 1.5: Added caption option

It also supports a top-classes option which requires one or more class names separated by comma. If specified inheritance traversal will stop at the specified class names. Given the following Python module:

(continued from previous page)

```
class A:
    pass

class B(A):
    pass

class C(A):
    pass

class D(B, C):
    pass

class E(B):
    pass

class F(C):
    pass
```

If you have specified a module in the inheritance diagram like this:

```
.. inheritance-diagram:: dummy.test
:top-classes: dummy.test.B, dummy.test.C
```

any base classes which are ancestors to top-classes and are also defined in the same module will be rendered as stand alone nodes. In this example class A will be rendered as stand alone node in the graph. This is a known issue due to how this extension works internally.

If you don't want class A (or any other ancestors) to be visible then specify only the classes you would like to generate the diagram for like this:

```
.. inheritance-diagram:: dummy.test.D dummy.test.E dummy.test.F :top-classes: dummy.test.B, dummy.test.C
```

Changed in version 1.7: Added top-classes option to limit the scope of inheritance graphs.

Examples

The following are different inheritance diagrams for the internal InheritanceDiagram class that implements the directive.

With full names:

Showing class names only:

.. inheritance-diagram:: sphinx.ext.inheritance_diagram.InheritanceDiagram
:parts: 1

Stopping the diagram at *sphinx.util.docutils.SphinxDirective* (the highest superclass still part of Sphinx), and dropping the common left-most part (sphinx) from all names:

```
.. inheritance-diagram:: sphinx.ext.inheritance_diagram.InheritanceDiagram
:top-classes: sphinx.util.docutils.SphinxDirective
:parts: -1
```

```
util.docutils.SphinxDirective ext.inheritance_diagram.InheritanceDiagram
```

${\bf class} \ {\bf sphinx.ext.inheritance_diagram.InheritanceDiagram}$

The internal class that implements the inheritance-diagram directive.

Configuration

inheritance_graph_attrs

A dictionary of graphviz graph attributes for inheritance diagrams.

For example:

inheritance_node_attrs

A dictionary of graphviz node attributes for inheritance diagrams.

For example:

inheritance_edge_attrs

A dictionary of graphviz edge attributes for inheritance diagrams.

inheritance_alias

Allows mapping the full qualified name of the class to custom values (useful when exposing the underlying path of a class is not desirable, e.g. it's a private class and should not be instantiated by the user).

For example:

```
inheritance_alias = {'_pytest.Magic': 'pytest.Magic'}
```

sphinx.ext.intersphinx - Link to other projects' documentation

New in version 0.5.

This extension can generate links to the documentation of objects in external projects, either explicitly through the *external* role, or as a fallback resolution for any other cross-reference.

Usage for fallback resolution is simple: whenever Sphinx encounters a cross-reference that has no matching target in the current documentation set, it looks for targets in the external documentation sets configured in <code>intersphinx_mapping</code>. A reference like <code>:py:class:`zipfile.ZipFile`</code> can then link to the Python documentation for the ZipFile class, without you having to specify where it is located exactly.

When using the *external* role, you can force lookup to any external projects, and optionally to a specific external project. A link like :external:ref:`comparison manual <comparisons>` will then link to the label "comparisons" in whichever configured external project, if it exists, and a link like :external+python:ref:`comparison manual <comparisons>` will link to the label "comparisons" only in the doc set "python", if it exists.

Behind the scenes, this works as follows:

- Each Sphinx HTML build creates a file named objects.inv that contains a mapping from object names to URIs relative to the HTML set's root.
- Projects using the Intersphinx extension can specify the location of such mapping files in the *intersphinx_mapping* config value. The mapping will then be used to resolve both *external* references, and also otherwise missing references to objects into links to the other documentation.
- By default, the mapping file is assumed to be at the same location as the rest of the documentation; however, the location of the mapping file can also be specified individually, e.g. if the docs should be buildable without Internet access.

Configuration

To use Intersphinx linking, add 'sphinx.ext.intersphinx' to your extensions config value, and use these config values to activate linking:

intersphinx_mapping

This config value contains the locations and names of other projects that should be linked to in this documentation.

Relative local paths for target locations are taken as relative to the base of the built documentation, while relative local paths for inventory locations are taken as relative to the source directory.

When fetching remote inventory files, proxy settings will be read from the \$HTTP_PROXY environment variable.

Format

New in version 1.0.

A dictionary mapping unique identifiers to a tuple (target, inventory). Each target is the base URI of a foreign Sphinx documentation set and can be a local path or an HTTP URI. The inventory indicates where the inventory file can be found: it can be None (an objects.inv file at the same location as the base URI) or another local file path or a full HTTP URI to an inventory file.

The unique identifier can be used in the *external* role, so that it is clear which intersphinx set the target belongs to. A link like external:python+ref:`comparison manual <comparisons>` will link to the label "comparisons" in the doc set "python", if it exists.

Example

To add links to modules and objects in the Python standard library documentation, use:

```
intersphinx_mapping = {'python': ('https://docs.python.org/3', None)}
```

This will download the corresponding objects.inv file from the Internet and generate links to the pages under the given URI. The downloaded inventory is cached in the Sphinx environment, so it must be re-downloaded whenever you do a full rebuild.

A second example, showing the meaning of a non-None value of the second tuple item:

This will read the inventory from python-inv.txt in the source directory, but still generate links to the pages under https://docs.python.org/3. It is up to you to update the inventory file as new objects are added to the Python documentation.

Multiple targets for the inventory

New in version 1.3.

Alternative files can be specified for each inventory. One can give a tuple for the second inventory tuple item as shown in the following example. This will read the inventory iterating through the (second) tuple items until the first successful fetch. The primary use case for this to specify mirror sites for server downtime of the primary inventory:

For a set of books edited and tested locally and then published together, it could be helpful to try a local inventory file first, to check references before publication:

Old format for this config value

Deprecated since version 6.2.

Caution: This is the format used before Sphinx 1.0. It is deprecated and will be removed in Sphinx 8.0.

A dictionary mapping URIs to either None or an URI. The keys are the base URI of the foreign Sphinx documentation sets and can be local paths or HTTP URIs. The values indicate where the inventory file can be found: they can be None (at the same location as the base URI) or another local or HTTP URI.

Example:

```
intersphinx_mapping = {'https://docs.python.org/': None}
```

intersphinx_cache_limit

The maximum number of days to cache remote inventories. The default is 5, meaning five days. Set this to a negative value to cache inventories for unlimited time.

intersphinx_timeout

The number of seconds for timeout. The default is None, meaning do not timeout.

Note: timeout is not a time limit on the entire response download; rather, an exception is raised if the server has not issued a response for timeout seconds.

intersphinx_disabled_reftypes

New in version 4.3.

Changed in version 5.0: Changed default value from an empty list to ['std:doc'].

A list of strings being either:

- the name of a specific reference type in a domain, e.g., std:doc, py:func, or cpp:class,
- the name of a domain, and a wildcard, e.g., std:*, py:*, or cpp:*, or
- simply a wildcard *.

The default value is ['std:doc'].

When a non-external cross-reference is being resolved by intersphinx, skip resolution if it matches one of the specifications in this list.

For example, with intersphinx_disabled_reftypes = ['std:doc'] cross-reference :doc:`installation` will not be attempted to be resolved intersphinx, :external+otherbook:doc:`installation` will be attempted to be resolved in the inventory named otherbook in intersphinx_mapping. At the same time, all cross-references generated in, e.g., Python, declarations will still be attempted to be resolved by intersphinx.

If * is in the list of domains, then no non-external references will be resolved by intersphinx.

Explicitly Reference External Objects

The Intersphinx extension provides the following role.

:external:

New in version 4.4.

Use Intersphinx to perform lookup only in external projects, and not the current project. Intersphinx still needs to know the type of object you would like to find, so the general form of this role is to write the cross-reference as if the object is in the current project, but then prefix it with :external. The two forms are then

- :external:domain:reftype:`target`, e.g., :external:py:class:`zipfile.ZipFile`, or
- :external:reftype: `target`, e.g., :external:doc: `installation`.

If you would like to constrain the lookup to a specific external project, then the key of the project, as specified in intersphinx_mapping, is added as well to get the two forms

- :external+invname:domain:reftype:`target`,e.g.,:external+python:py:class:`zipfile. ZipFile`, or
- :external+invname:reftype: `target`, e.g., :external+python:doc: `installation`.

Showing all links of an Intersphinx mapping file

To show all Intersphinx links and their targets of an Intersphinx mapping file, run python -msphinx.ext. intersphinx url-or-path. This is helpful when searching for the root cause of a broken Intersphinx link in a documentation project. The following example prints the Intersphinx mapping of the Python 3 documentation:

```
$ python -m sphinx.ext.intersphinx https://docs.python.org/3/objects.inv
```

Using Intersphinx with inventory file under Basic Authorization

Intersphinx supports Basic Authorization like this:

The user and password will be stripped from the URL when generating the links.

sphinx.ext.linkcode - Add external links to source code

Module author: Pauli Virtanen

New in version 1.2.

This extension looks at your object descriptions (.. class::, .. function:: etc.) and adds external links to code hosted somewhere on the web. The intent is similar to the sphinx.ext.viewcode extension, but assumes the source code can be found somewhere on the Internet.

In your configuration, you need to specify a linkcode_resolve function that returns an URL based on the object.

Configuration

linkcode resolve

This is a function linkcode_resolve(domain, info), which should return the URL to source code corresponding to the object in given domain with given information.

The function should return None if no link is to be added.

The argument domain specifies the language domain the object is in. info is a dictionary with the following keys guaranteed to be present (dependent on the domain):

- py: module (name of the module), fullname (name of the object)
- c: names (list of names for the object)
- cpp: names (list of names for the object)
- javascript: object (name of the object), fullname (name of the item)

Example:

```
def linkcode_resolve(domain, info):
    if domain != 'py':
        return None
    if not info['module']:
        return None
    (continues on next page)
```

(continued from previous page)

```
filename = info['module'].replace('.', '/')
return "https://somesite/sourcerepo/%s.py" % filename
```

Math support for HTML outputs in Sphinx

New in version 0.5.

Changed in version 1.8: Math support for non-HTML builders is integrated to sphinx-core. So mathbase extension is no longer needed.

Since mathematical notation isn't natively supported by HTML in any way, Sphinx gives a math support to HTML document with several extensions. These use the reStructuredText math *directive* and *role*.

sphinx.ext.imgmath - Render math as images

New in version 1.4.

This extension renders math via LaTeX and dvipng³¹⁷ or dvisvgm³¹⁸ into PNG or SVG images. This of course means that the computer where the docs are built must have both programs available.

There are various configuration values you can set to influence how the images are built:

imgmath_image_format

The output image format. The default is 'png'. It should be either 'png' or 'svg'. The image is produced by first executing latex on the TeX mathematical mark-up then (depending on the requested format) either dvipng³¹⁹ or dvisvgm³²⁰.

imgmath_use_preview

dvipng and dvisvgm both have the ability to collect from LaTeX the "depth" of the rendered math: an inline image should use this "depth" in a vertical-align style to get correctly aligned with surrounding text.

This mechanism requires the LaTeX preview package³²¹ (available as preview-latex-style on Ubuntu xenial). Therefore, the default for this option is False but it is strongly recommended to set it to True.

Changed in version 2.2: This option can be used with the 'svg' imgmath_image_format.

imamath add tooltips

Default: True. If false, do not add the LaTeX code as an "alt" attribute for math images.

imgmath_font_size

The font size (in pt) of the displayed math. The default value is 12. It must be a positive integer.

imgmath_latex

The command name with which to invoke LaTeX. The default is 'latex'; you may need to set this to a full path if latex is not in the executable search path.

Since this setting is not portable from system to system, it is normally not useful to set it in conf.py; rather, giving it on the **sphinx-build** command line via the -D option should be preferable, like this:

```
sphinx-build -M html -D imgmath_latex=C:\tex\latex.exe . _build
```

³¹⁷ https://savannah.nongnu.org/projects/dvipng/

³¹⁸ https://dvisvgm.de/

³¹⁹ https://savannah.nongnu.org/projects/dvipng/

³²⁰ https://dvisvgm.de/

³²¹ https://www.gnu.org/software/auctex/preview-latex.html

This value should only contain the path to the latex executable, not further arguments; use *imgmath_latex_args* for that purpose.

Hint: To use OpenType Math fonts³²² with unicode-math, via a custom <code>imgmath_latex_preamble</code>, you can set <code>imgmath_latex</code> to 'dvilualatex', but must then set <code>imgmath_image_format</code> to 'svg'. Note: this has only been tested with dvisvgm 3.0.3. It significantly increases image production duration compared to using standard 'latex' with traditional TeX math fonts.

Hint: Some fancy LaTeX mark-up (an example was reported which used TikZ to add various decorations to the equation) require multiple runs of the LaTeX executable. To handle this, set this configuration setting to 'latexmk' (or a full path to it) as this Perl script reliably chooses dynamically how many latex runs are needed.

Changed in version 6.2.0: Using 'xelatex' (or a full path to it) is now supported. But you must then add '-no-pdf' to the <code>imgmath_latex_args</code> list of the command options. The 'svg' <code>imgmath_image_format</code> is required. Also, you may need the <code>dvisvgm</code> binary to be relatively recent (testing was done only with its 3.0.3 release).

Note: Regarding the previous note, it is currently not supported to use latexmk with option -xelatex.

imgmath_latex_args

Additional arguments to give to latex, as a list. The default is an empty list.

imgmath_latex_preamble

Additional LaTeX code to put into the preamble of the LaTeX files used to translate the math snippets. This is left empty by default. Use it e.g. to add packages which modify the fonts used for math, such as '\\usepackage{newtxsf}' for sans-serif fonts, or '\usepackage{fouriernc}' for serif fonts. Indeed, the default LaTeX math fonts have rather thin glyphs which (in HTML output) often do not match well with the font for text.

imgmath_dvipng

The command name to invoke dvipng. The default is 'dvipng'; you may need to set this to a full path if dvipng is not in the executable search path. This option is only used when imgmath_image_format is set to 'png'.

imgmath_dvipng_args

Additional arguments to give to dvipng, as a list. The default value is ['-gamma', '1.5', '-D', '110', '-bg', 'Transparent'] which makes the image a bit darker and larger then it is by default (this compensates somewhat for the thinness of default LaTeX math fonts), and produces PNGs with a transparent background. This option is used only when imgmath_image_format is 'png'.

imgmath_dvisvgm

The command name to invoke dvisvgm. The default is 'dvisvgm'; you may need to set this to a full path if dvisvgm is not in the executable search path. This option is only used when imgmath_image_format is 'svg'.

imgmath_dvisvgm_args

Additional arguments to give to dvisvgm, as a list. The default value is ['--no-fonts'], which means that dvisvgm will render glyphs as path elements (cf the dvisvgm FAQ³²³). This option is used only when imgmath_image_format is 'svg'.

³²² https://tex.stackexchange.com/questions/425098/which-opentype-math-fonts-are-available

³²³ https://dvisvgm.de/FAQ

imgmath_embed

Default: False. If true, encode LaTeX output images within HTML files (base64 encoded) and do not save separate png/svg files to disk.

New in version 5.2.

sphinx.ext.mathjax - Render math via JavaScript

Warning: Version 4.0 changes the version of MathJax used to version 3. You may need to override mathjax_path to https://cdn.jsdelivr.net/npm/mathjax@2/MathJax.js?config=TeX-AMS-MML_HTMLorMML or update your configuration options for version 3 (see mathjax3_config).

New in version 1.1.

This extension puts math as-is into the HTML files. The JavaScript package MathJax³²⁴ is then loaded and transforms the LaTeX markup to readable math live in the browser.

Because MathJax (and the necessary fonts) is very large, it is not included in Sphinx but is set to automatically include it from a third-party site.

Attention: You should use the math *directive* and *role*, not the native MathJax \$\$, \(, etc.

mathjax_path

The path to the JavaScript file to include in the HTML files in order to load MathJax.

The default is the https:// URL that loads the JS files from the jsdelivr³²⁵ Content Delivery Network. See the MathJax Getting Started page³²⁶ for details. If you want MathJax to be available offline or without including resources from a third-party site, you have to download it and set this value to a different path.

The path can be absolute or relative; if it is relative, it is relative to the _static directory of the built docs.

For example, if you put MathJax into the static path of the Sphinx docs, this value would be MathJax/MathJax. js. If you host more than one Sphinx documentation set on one server, it is advisable to install MathJax in a shared location.

You can also give a full https:// URL different from the CDN URL.

mathjax_options

The options to script tag for mathjax. For example, you can set integrity option with following setting:

```
mathjax_options = {
    'integrity': 'sha384-....',
}
```

The default is empty $(\{\})$.

New in version 1.8.

Changed in version 4.4.1: Allow to change the loading method (async or defer) of MathJax if "async" or "defer" key is set.

³²⁴ https://www.mathjax.org/

³²⁵ https://www.jsdelivr.com/

³²⁶ https://www.mathjax.org/#gettingstarted

mathjax3_config

The configuration options for MathJax v3 (which is used by default). The given dictionary is assigned to the JavaScript variable window.MathJax. For more information, please read Configuring MathJax³²⁷.

The default is empty (not configured).

New in version 4.0.

mathjax2_config

The configuration options for MathJax v2 (which can be loaded via mathjax_path). The value is used as a parameter of MathJax.Hub.Config(). For more information, please read Using in-line configuration options³²⁸.

For example:

```
mathjax2_config = {
    'extensions': ['tex2jax.js'],
    'jax': ['input/TeX', 'output/HTML-CSS'],
}
```

The default is empty (not configured).

New in version 4.0: math jax_config has been renamed to math jax2_config.

mathjax_config

Former name of mathjax2_config.

For help converting your old MathJax configuration to to the new *mathjax3_config*, see Converting Your v2 Configuration to v3³²⁹.

New in version 1.8.

Changed in version 4.0: This has been renamed to mathjax2_config. mathjax_config is still supported for backwards compatibility.

sphinx.ext.jsmath - Render math via JavaScript

This extension works just as the MathJax extension does, but uses the older package jsMath³³⁰. It provides this config value:

jsmath_path

The path to the JavaScript file to include in the HTML files in order to load JSMath. There is no default.

The path can be absolute or relative; if it is relative, it is relative to the _static directory of the built docs.

For example, if you put JSMath into the static path of the Sphinx docs, this value would be jsMath/easy/load. js. If you host more than one Sphinx documentation set on one server, it is advisable to install jsMath in a shared location.

³³⁰ https://www.math.union.edu/~dpvc/jsmath/

sphinx.ext.napoleon - Support for NumPy and Google style docstrings

Module author: Rob Ruana

New in version 1.3.

Overview

Are you tired of writing docstrings that look like this:

```
:param path: The path of the file to wrap
:type path: str
:param field_storage: The :class:`FileStorage` instance to wrap
:type field_storage: FileStorage
:param temporary: Whether or not to delete the file when the File
   instance is destructed
:type temporary: bool
:returns: A buffered writable file descriptor
:rtype: BufferedFileStorage
```

reStructuredText³³¹ is great, but it creates visually dense, hard to read **docstrings**³³². Compare the jumble above to the same thing rewritten according to the Google Python Style Guide³³³:

```
Args:
    path (str): The path of the file to wrap
    field_storage (FileStorage): The :class:`FileStorage` instance to wrap
    temporary (bool): Whether or not to delete the file when the File
    instance is destructed

Returns:
    BufferedFileStorage: A buffered writable file descriptor
```

Much more legible, no?

Napoleon is a *extension* that enables Sphinx to parse both NumPy³³⁴ and Google³³⁵ style docstrings - the style recommended by Khan Academy³³⁶.

Napoleon is a pre-processor that parses NumPy³³⁷ and Google³³⁸ style docstrings and converts them to reStructuredText before Sphinx attempts to parse them. This happens in an intermediate step while Sphinx is processing the documentation, so it doesn't modify any of the docstrings in your actual source code files.

```
331 https://docutils.sourceforge.io/rst.html
```

³³² https://peps.python.org/pep-0287/

³³³ https://google.github.io/styleguide/pyguide.html

³³⁴ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

³³⁵ https://google.github.io/styleguide/pyguide.html#38-comments-and-docstrings

³³⁶ https://github.com/Khan/style-guides/blob/master/style/python.md#docstrings

³³⁷ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

³³⁸ https://google.github.io/styleguide/pyguide.html#38-comments-and-docstrings

Getting Started

1. After setting up Sphinx to build your docs, enable napoleon in the Sphinx conf.py file:

```
# conf.py

# Add napoleon to the extensions list
extensions = ['sphinx.ext.napoleon']
```

2. Use *sphinx-apidoc* to build your API documentation:

```
$ sphinx-apidoc -f -o docs/source projectdir
```

Docstrings

Napoleon interprets every docstring that *autodoc* can find, including docstrings on: modules, classes, attributes, methods, functions, and variables. Inside each docstring, specially formatted *Sections* are parsed and converted to reStructuredText.

All standard reStructuredText formatting still works as expected.

Docstring Sections

All of the following section headers are supported:

- Args (alias of Parameters)
- Arguments (alias of Parameters)
- Attention
- Attributes
- Caution
- Danger
- Error
- Example
- Examples
- Hint
- Important
- Keyword Args (alias of Keyword Arguments)
- Keyword Arguments
- Methods
- Note
- Notes
- Other Parameters
- Parameters

- Return (alias of Returns)
- Returns
- Raise (alias of Raises)
- Raises
- References
- See Also
- Tip
- Todo
- Warning
- Warnings (alias of Warning)
- Warn (alias of Warns)
- Warns
- Yield (alias of Yields)
- Yields

Google vs NumPy

Napoleon supports two styles of docstrings: Google³³⁹ and NumPy³⁴⁰. The main difference between the two styles is that Google uses indentation to separate sections, whereas NumPy uses underlines.

Google style:

```
def func(arg1, arg2):
    """Summary line.

    Extended description of function.

Args:
        arg1 (int): Description of arg1
        arg2 (str): Description of arg2

Returns:
        bool: Description of return value

"""
return True
```

NumPy style:

```
def func(arg1, arg2):
    """Summary line.
    Extended description of function.
    (continues on next page)
```

⁽comments on)

 $^{^{339}}$ https://google.github.io/styleguide/pyguide.html#38-comments-and-docstrings 340 https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

(continued from previous page)

```
Parameters
------
arg1: int
Description of arg1
arg2: str
Description of arg2

Returns
-----
bool
Description of return value
"""
return True
```

NumPy style tends to require more vertical space, whereas Google style tends to use more horizontal space. Google style tends to be easier to read for short and simple docstrings, whereas NumPy style tends be easier to read for long and in-depth docstrings.

The choice between styles is largely aesthetic, but the two styles should not be mixed. Choose one style for your project and be consistent with it.

See also:

For complete examples:

- example_google
- example_numpy

Type Annotations

PEP 484³⁴¹ introduced a standard way to express types in Python code. This is an alternative to expressing types directly in docstrings. One benefit of expressing types according to **PEP 484**³⁴² is that type checkers and IDEs can take advantage of them for static code analysis. **PEP 484**³⁴³ was then extended by **PEP 526**³⁴⁴ which introduced a similar way to annotate variables (and attributes).

Google style with Python 3 type annotations:

```
def func(arg1: int, arg2: str) -> bool:
    """Summary line.

Extended description of function.

Args:
    arg1: Description of arg1
    arg2: Description of arg2

Returns:
    Description of return value

(continues on next page)
```

341 https://peps.python.org/pep-0484/

³⁴² https://peps.python.org/pep-0484/

³⁴³ https://peps.python.org/pep-0484/

³⁴⁴ https://peps.python.org/pep-0526/

(continued from previous page)

```
return True

class Class:
    """Summary line.

Extended description of class

Attributes:
    attr1: Description of attr1
    attr2: Description of attr2

"""
```

Google style with types in docstrings:

```
def func(arg1, arg2):
   """Summary line.
   Extended description of function.
   Args:
        arg1 (int): Description of arg1
        arg2 (str): Description of arg2
   Returns:
       bool: Description of return value
   .....
   return True
class Class:
   """Summary line.
   Extended description of class
   Attributes:
        attr1 (int): Description of attr1
       attr2 (str): Description of attr2
```

Note: Python 2/3 compatible annotations³⁴⁵ aren't currently supported by Sphinx and won't show up in the docs.

 $^{^{345}\} https://peps.python.org/pep-0484/\# suggested-syntax-for-python-2-7-and-straddling-code$

Configuration

Listed below are all the settings used by napoleon and their default values. These settings can be changed in the Sphinx *conf.py* file. Make sure that "sphinx.ext.napoleon" is enabled in *conf.py*:

```
# conf.py
# Add any Sphinx extension module names here, as strings
extensions = ['sphinx.ext.napoleon']
# Napoleon settings
napoleon_google_docstring = True
napoleon_numpy_docstring = True
napoleon_include_init_with_doc = False
napoleon_include_private_with_doc = False
napoleon_include_special_with_doc = True
napoleon_use_admonition_for_examples = False
napoleon_use_admonition_for_notes = False
napoleon_use_admonition_for_references = False
napoleon_use_ivar = False
napoleon_use_param = True
napoleon_use_rtype = True
napoleon_preprocess_types = False
napoleon_type_aliases = None
napoleon_attr_annotations = True
```

napoleon_google_docstring

True to parse Google style 346 docstrings. False to disable support for Google style docstrings. Defaults to True.

napoleon_numpy_docstring

True to parse NumPy style³⁴⁷ docstrings. False to disable support for NumPy style docstrings. *Defaults to True*.

napoleon_include_init_with_doc

True to list __init___ docstrings separately from the class docstring. False to fall back to Sphinx's default behavior, which considers the __init___ docstring as part of the class documentation. *Defaults to False*.

If True:

```
def __init__(self):
    """
    This will be included in the docs because it has a docstring
    """

def __init__(self):
    # This will NOT be included in the docs
```

napoleon_include_private_with_doc

True to include private members (like _membername) with docstrings in the documentation. False to fall back to Sphinx's default behavior. *Defaults to False*.

If True:

 $^{^{346}\} https://google.github.io/styleguide/pyguide.html \#38-comments-and-docstrings$

³⁴⁷ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

```
def _included(self):
    """
    This will be included in the docs because it has a docstring
    """
    pass

def _skipped(self):
    # This will NOT be included in the docs
    pass
```

napoleon_include_special_with_doc

True to include special members (like __membername__) with docstrings in the documentation. False to fall back to Sphinx's default behavior. *Defaults to True*.

If True:

```
def __str__(self):
    """
    This will be included in the docs because it has a docstring
    """
    return unicode(self).encode('utf-8')

def __unicode__(self):
    # This will NOT be included in the docs
    return unicode(self.__class__.__name__)
```

napoleon_use_admonition_for_examples

True to use the .. admonition:: directive for the **Example** and **Examples** sections. False to use the .. rubric:: directive instead. One may look better than the other depending on what HTML theme is used. *Defaults to False*.

This NumPy style³⁴⁸ snippet will be converted as follows:

```
Example
-----
This is just a quick example
```

If True:

```
.. admonition:: Example

This is just a quick example
```

If False:

```
.. rubric:: Example
This is just a quick example
```

napoleon_use_admonition_for_notes

True to use the .. admonition:: directive for **Notes** sections. False to use the .. rubric:: directive instead. *Defaults to False*.

³⁴⁸ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

Note: The singular **Note** section will always be converted to a .. note:: directive.

See also:

napoleon_use_admonition_for_examples

napoleon_use_admonition_for_references

True to use the .. admonition:: directive for **References** sections. False to use the .. rubric:: directive instead. *Defaults to False*.

See also:

napoleon_use_admonition_for_examples

napoleon_use_ivar

True to use the :ivar: role for instance variables. False to use the .. attribute:: directive instead. *Defaults to False*.

This NumPy style³⁴⁹ snippet will be converted as follows:

```
Attributes
-----
attr1 : int
Description of `attr1`
```

If True:

```
:ivar attr1: Description of `attr1`
:vartype attr1: int
```

If False:

```
.. attribute:: attr1

Description of `attr1`

:type: int
```

napoleon_use_param

True to use a :param: role for each function parameter. False to use a single :parameters: role for all the parameters. *Defaults to True*.

This NumPy style³⁵⁰ snippet will be converted as follows:

```
Parameters
-----
arg1 : str
Description of `arg1`
arg2 : int, optional
Description of `arg2`, defaults to 0
```

If True:

³⁴⁹ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

```
:param arg1: Description of `arg1`
:type arg1: str
:param arg2: Description of `arg2`, defaults to 0
:type arg2: :class:`int`, *optional*
```

If False:

napoleon_use_keyword

True to use a :keyword: role for each function keyword argument. False to use a single :keyword arguments: role for all the keywords. *Defaults to True*.

This behaves similarly to *napoleon_use_param*. Note unlike docutils, :keyword: and :param: will not be treated the same way - there will be a separate "Keyword Arguments" section, rendered in the same fashion as "Parameters" section (type links created if possible)

See also:

napoleon_use_param

napoleon_use_rtype

True to use the :rtype: role for the return type. False to output the return type inline with the description. *Defaults to True*.

This NumPy style³⁵¹ snippet will be converted as follows:

```
Returns
-----
bool
True if successful, False otherwise
```

If True:

```
:returns: True if successful, False otherwise
:rtype: bool
```

If False:

```
:returns: *bool* -- True if successful, False otherwise
```

napoleon_preprocess_types

True to convert the type definitions in the docstrings as references. Defaults to *False*.

New in version 3.2.1.

Changed in version 3.5: Do preprocess the Google style docstrings also.

napoleon_type_aliases

A mapping to translate type names to other names or references. Works only when napoleon_use_param = True. *Defaults to None*.

With:

³⁵⁰ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

³⁵¹ https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

```
napoleon_type_aliases = {
    "CustomType": "mypackage.CustomType",
    "dict-like": ":term:`dict-like <mapping>`",
}
```

This NumPy style³⁵² snippet:

```
Parameters
------
arg1 : CustomType
   Description of `arg1`
arg2 : dict-like
   Description of `arg2`
```

becomes:

```
:param arg1: Description of `arg1`
:type arg1: mypackage.CustomType
:param arg2: Description of `arg2`
:type arg2: :term:`dict-like <mapping>`
```

New in version 3.2.

napoleon_attr_annotations

True to allow using PEP 526³⁵³ attributes annotations in classes. If an attribute is documented in the docstring without a type and has an annotation in the class body, that type is used.

New in version 3.4.

napoleon_custom_sections

Add a list of custom sections to include, expanding the list of parsed sections. Defaults to None.

The entries can either be strings or tuples, depending on the intention:

- To create a custom "generic" section, just pass a string.
- To create an alias for an existing section, pass a tuple containing the alias name and the original, in that order.
- To create a custom section that displays like the parameters or returns section, pass a tuple containing the custom section name and a string value, "params_style" or "returns_style".

If an entry is just a string, it is interpreted as a header for a generic section. If the entry is a tuple/list/indexed container, the first entry is the name of the section, the second is the section key to emulate. If the second entry value is "params_style" or "returns_style", the custom section will be displayed like the parameters section or returns section.

New in version 1.8.

Changed in version 3.5: Support params_style and returns_style

³⁵² https://numpydoc.readthedocs.io/en/latest/format.html#docstring-standard

³⁵³ https://peps.python.org/pep-0526/

sphinx.ext.todo - Support for todo items

Module author: Daniel Bültmann

New in version 0.5.

There are two additional directives when using this extension:

.. todo::

Use this directive like, for example, note.

It will only show up in the output if todo_include_todos is True.

New in version 1.3.2: This directive supports an class option that determines the class attribute for HTML output. If not given, the class defaults to admonition-todo.

.. todolist::

This directive is replaced by a list of all todo directives in the whole documentation, if todo_include_todos is True.

These can be configured as seen below.

Configuration

todo_include_todos

If this is True, todo and todolist produce output, else they produce nothing. The default is False.

todo_emit_warnings

If this is True, todo emits a warning for each TODO entries. The default is False.

New in version 1.5.

todo_link_only

If this is True, todolist produce output without file path and line, The default is False.

New in version 1.4.

autodoc provides the following an additional event:

todo-defined(app, node)

New in version 1.5.

Emitted when a todo is defined. *node* is the defined sphinx.ext.todo.todo_node node.

sphinx.ext.viewcode - Add links to highlighted source code

Module author: Georg Brandl

New in version 1.0.

This extension looks at your Python object descriptions (.. class::, .. function:: etc.) and tries to find the source files where the objects are contained. When found, a separate HTML page will be output for each module with a highlighted version of the source code, and a link will be added to all object descriptions that leads to the source code of the described object. A link back from the source to the description will also be inserted.

Warning: Basically, viewcode extension will import the modules being linked to. If any modules have side effects on import, these will be executed when sphinx-build is run.

If you document scripts (as opposed to library modules), make sure their main routine is protected by a if __name__ == '__main__' condition.

In addition, if you don't want to import the modules by viewcode, you can tell the location of the location of source code to viewcode using the *viewcode-find-source* event.

If *viewcode_follow_imported_members* is enabled, you will also need to resolve imported attributes using the *viewcode-follow-imported* event.

This extension works only on HTML related builders like html, applehelp, devhelp, htmlhelp, qthelp and so on except singlehtml. By default epub builder doesn't support this extension (see *viewcode_enable_epub*).

Configuration

viewcode_follow_imported_members

If this is True, viewcode extension will emit *viewcode-follow-imported* event to resolve the name of the module by other extensions. The default is True.

New in version 1.3.

Changed in version 1.8: Renamed from viewcode_import to viewcode_follow_imported_members.

viewcode_enable_epub

If this is True, viewcode extension is also enabled even if you use epub builders. This extension generates pages outside toctree, but this is not preferred as epub format.

Until 1.4.x, this extension is always enabled. If you want to generate epub as same as 1.4.x, you should set True, but epub format checker's score becomes worse.

The default is False.

New in version 1.5.

Warning: Not all epub readers support pages generated by viewcode extension. These readers ignore links to pages are not under toctree.

Some reader's rendering result are corrupted and epubcheck³⁵⁴'s score becomes worse even if the reader supports.

viewcode_line_numbers

Default: False.

If set to True, inline line numbers will be added to the highlighted code.

New in version 7.2.

viewcode-find-source(app, modname)

New in version 1.8.

Find the source code for a module. An event handler for this event should return a tuple of the source code itself and a dictionary of tags. The dictionary maps the name of a class, function, attribute, etc to a tuple of its type, the start line number, and the end line number. The type should be one of "class", "def", or "other".

³⁵⁴ https://github.com/IDPF/epubcheck

Parameters

- app The Sphinx application object.
- modname The name of the module to find source code for.

viewcode-follow-imported(app, modname, attribute)

New in version 1.8.

Find the name of the original module for an attribute.

Parameters

- app The Sphinx application object.
- **modname** The name of the module that the attribute belongs to.
- attribute The name of the member to follow.

Third-party extensions

You can find several extensions contributed by users in the sphinx-contrib³⁵⁵ organization. If you wish to include your extension in this organization, simply follow the instructions provided in the github-administration³⁵⁶ project. This is optional and there are several extensions hosted elsewhere. The awesome-sphinxdoc³⁵⁷ and sphinx-extensions³⁵⁸ projects are both curated lists of Sphinx packages, and many packages use the Framework:: Sphinx:: Extension³⁵⁹ and Framework:: Sphinx:: Theme³⁶⁰ trove classifiers for Sphinx extensions and themes, respectively.

Where to put your own extensions?

Extensions local to a project should be put within the project's directory structure. Set Python's module search path, sys.path, accordingly so that Sphinx can find them. For example, if your extension foo.py lies in the exts subdirectory of the project root, put into conf.py:

```
import sys, os
sys.path.append(os.path.abspath('exts'))
extensions = ['foo']
```

You can also install extensions anywhere else on sys.path, e.g. in the site-packages directory.

4.8 HTML Theming

Sphinx provides a number of builders for HTML and HTML-based formats.

Builders

Todo: Populate when the 'builders' document is split up.

Themes

New in version 0.6.

Note: This section provides information about using pre-existing HTML themes. If you wish to create your own theme, refer to *HTML theme development*.

Sphinx supports changing the appearance of its HTML output via *themes*. A theme is a collection of HTML templates, stylesheet(s) and other static files. Additionally, it has a configuration file which specifies from which theme to inherit, which highlighting style to use, and what options exist for customizing the theme's look and feel.

Themes are meant to be project-unaware, so they can be used for different projects without change.

Using a theme

Using a *theme provided with Sphinx* is easy. Since these do not need to be installed, you only need to set the *html_theme* config value. For example, to enable the classic theme, add the following to conf.py:

```
html_theme = "classic"
```

You can also set theme-specific options using the *html_theme_options* config value. These options are generally used to change the look and feel of the theme. For example, to place the sidebar on the right side and a black background for the relation bar (the bar with the navigation links at the page's top and bottom), add the following conf.py:

```
html_theme_options = {
    "rightsidebar": "true",
    "relbarbgcolor": "black"
}
```

If the theme does not come with Sphinx, it can be in two static forms or as a Python package. For the static forms, either a directory (containing theme.conf and other needed files), or a zip file with the same contents is supported. The directory or zipfile must be put where Sphinx can find it; for this there is the config value <a href="https://h

```
html_theme = "blue"
html_theme_path = ["."]
```

The third form is a Python package. If a theme you want to use is distributed as a Python package, you can use it after installing

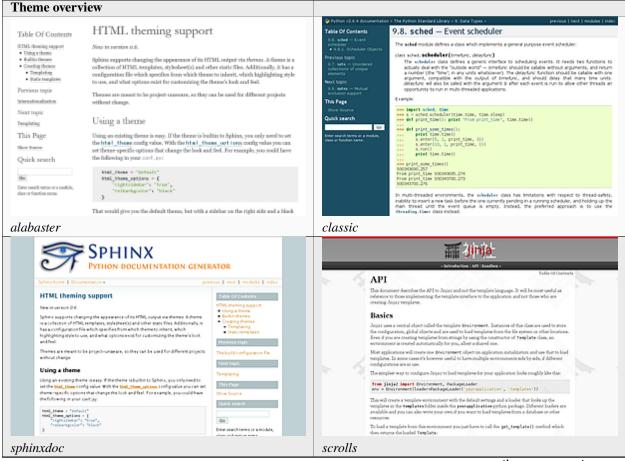

```
# installing theme package
$ pip install sphinxjp.themes.dotted
```

Once installed, this can be used in the same manner as a directory or zipfile-based theme:

```
html_theme = "dotted"
```

For more information on the design of themes, including information about writing your own themes, refer to *HTML* theme development.

Builtin themes

continues on next page

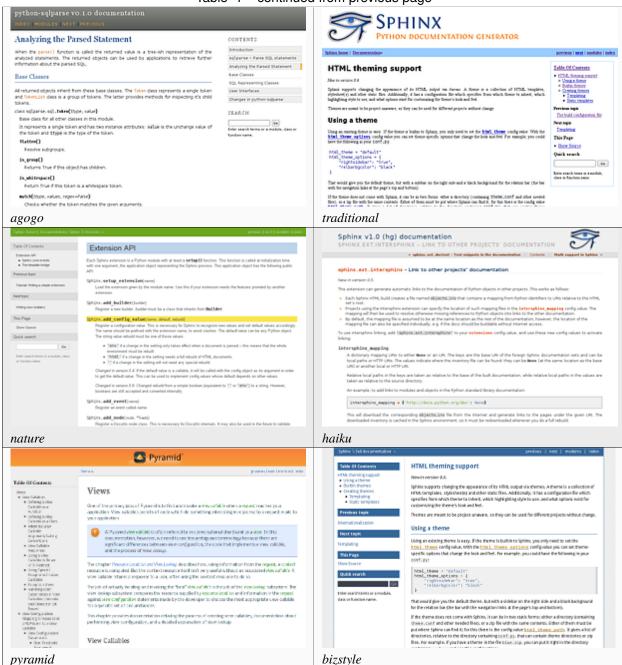

Table 1 – continued from previous page

Sphinx comes with a selection of themes to choose from.

Note that from these themes only the Alabaster and Scrolls themes are mobile-optimated, the other themes resort to horizontal scrolling if the screen is too narrow.

These themes are:

basic

This is a basically unstyled layout used as the base for the other themes, and usable as the base for custom themes as well. The HTML contains all important elements like sidebar and relation bar. There are these options (which are inherited by the other themes):

- nosidebar (true or false): Don't include the sidebar. Defaults to False.
- **sidebarwidth** (int or str): Width of the sidebar in pixels. This can be an int, which is interpreted as pixels or a valid CSS dimension string such as '70em' or '50%'. Defaults to 230 pixels.
- **body_min_width** (int or str): Minimal width of the document body. This can be an int, which is interpreted as pixels or a valid CSS dimension string such as '70em' or '50%'. Use 0 if you don't want a width limit. Defaults may depend on the theme (often 450px).
- **body_max_width** (int or str): Maximal width of the document body. This can be an int, which is interpreted as pixels or a valid CSS dimension string such as '70em' or '50%'. Use 'none' if you don't want a width limit. Defaults may depend on the theme (often 800px).
- navigation_with_keys (true or false): Allow navigating with the following keyboard shortcuts:
 - Left arrow: previous page
 - Right arrow: next page

Defaults to False.

 enable_search_shortcuts (true or false): Allow jumping to the search box with / and allow removal of search highlighting with Esc.

Defaults to True.

• **globaltoc_collapse** (true or false): Only expand subsections of the current document in **globaltoc.html** (see html_sidebars). Defaults to True.

New in version 3.1.

• **globaltoc_includehidden** (true or false): Show even those subsections in **globaltoc.html** (see html_sidebars) which have been included with the :hidden: flag of the toctree directive. Defaults to False.

New in version 3.1.

• **globaltoc_maxdepth** (int): The maximum depth of the toctree in **globaltoc.html** (see html_sidebars). Set it to -1 to allow unlimited depth. Defaults to the max depth selected in the toctree directive.

New in version 3.2.

alabaster

Alabaster theme³⁶¹ is a modified "Kr" Sphinx theme from @kennethreitz (especially as used in his Requests project), which was itself originally based on @mitsuhiko's theme used for Flask & related projects. Refer to its installation page³⁶² for information on how to configure *html_sidebars* for its use.

classic

This is the classic theme, which looks like the Python 2 documentation³⁶³. It can be customized via these options:

- rightsidebar (true or false): Put the sidebar on the right side. Defaults to False.
- **stickysidebar** (true or false): Make the sidebar "fixed" so that it doesn't scroll out of view for long body content. This may not work well with all browsers. Defaults to False.
- **collapsiblesidebar** (true or false): Add an *experimental* JavaScript snippet that makes the sidebar collapsible via a button on its side. Defaults to False.
- externalrefs (true or false): Display external links differently from internal links. Defaults to False.

³⁶¹ https://pypi.org/project/alabaster/

³⁶² https://alabaster.readthedocs.io/en/latest/installation.html

³⁶³ https://docs.python.org/2/

There are also various color and font options that can change the color scheme without having to write a custom stylesheet:

- footerbgcolor (CSS color): Background color for the footer line.
- footertextcolor (CSS color): Text color for the footer line.
- **sidebarbgcolor** (CSS color): Background color for the sidebar.
- **sidebarbtncolor** (CSS color): Background color for the sidebar collapse button (used when *collapsi-blesidebar* is True).
- sidebartextcolor (CSS color): Text color for the sidebar.
- sidebarlinkcolor (CSS color): Link color for the sidebar.
- relbarbgcolor (CSS color): Background color for the relation bar.
- relbartextcolor (CSS color): Text color for the relation bar.
- relbarlinkcolor (CSS color): Link color for the relation bar.
- bgcolor (CSS color): Body background color.
- textcolor (CSS color): Body text color.
- linkcolor (CSS color): Body link color.
- visitedlinkcolor (CSS color): Body color for visited links.
- headbgcolor (CSS color): Background color for headings.
- headtextcolor (CSS color): Text color for headings.
- headlinkcolor (CSS color): Link color for headings.
- codebgcolor (CSS color): Background color for code blocks.
- **codetextcolor** (CSS color): Default text color for code blocks, if not set differently by the highlighting style.
- bodyfont (CSS font-family): Font for normal text.
- headfont (CSS font-family): Font for headings.

sphinxdoc

The theme originally used by this documentation. It features a sidebar on the right side. There are currently no options beyond *nosidebar* and *sidebarwidth*.

Note: The Sphinx documentation now uses an adjusted version of the sphinxdoc theme³⁶⁴.

scrolls

A more lightweight theme, based on the Jinja documentation³⁶⁵. The following color options are available:

- · headerbordercolor
- · subheadlinecolor
- linkcolor
- visitedlinkcolor
- admonitioncolor

4.8. HTML Theming

³⁶⁴ https://github.com/sphinx-doc/sphinx/tree/master/doc/_themes/sphinx13

³⁶⁵ https://jinja.palletsprojects.com/

agogo

A theme created by Andi Albrecht. The following options are supported:

- **bodyfont** (CSS font family): Font for normal text.
- headerfont (CSS font family): Font for headings.
- pagewidth (CSS length): Width of the page content, default 70em.
- documentwidth (CSS length): Width of the document (without sidebar), default 50em.
- sidebarwidth (CSS length): Width of the sidebar, default 20em.
- rightsidebar (true or false): Put the sidebar on the right side. Defaults to True.
- **bgcolor** (CSS color): Background color.
- headerbg (CSS value for "background"): background for the header area, default a grayish gradient.
- footerbg (CSS value for "background"): background for the footer area, default a light gray gradient.
- linkcolor (CSS color): Body link color.
- headercolor1, headercolor2 (CSS color): colors for <h1> and <h2> headings.
- headerlinkcolor (CSS color): Color for the backreference link in headings.
- textalign (CSS text-align value): Text alignment for the body, default is justify.

nature

A greenish theme. There are currently no options beyond nosidebar and sidebarwidth.

pyramid

A theme from the Pyramid web framework project, designed by Blaise Laflamme. There are currently no options beyond *nosidebar* and *sidebarwidth*.

haiku

A theme without sidebar inspired by the Haiku OS user guide³⁶⁶. The following options are supported:

- **full_logo** (true or false, default False): If this is true, the header will only show the <a href="http://https://h
- textcolor, headingcolor, linkcolor, visitedlinkcolor, hoverlinkcolor (CSS colors): Colors for various body elements.

traditional

A theme resembling the old Python documentation. There are currently no options beyond *nosidebar* and *sidebarwidth*.

epub

A theme for the epub builder. This theme tries to save visual space which is a sparse resource on ebook readers. The following options are supported:

- relbar1 (true or false, default True): If this is true, the relbar1 block is inserted in the epub output, otherwise it is omitted.
- **footer** (true or false, default True): If this is true, the *footer* block is inserted in the epub output, otherwise it is omitted.

bizstyle

A simple bluish theme. The following options are supported beyond nosidebar and sidebarwidth:

• rightsidebar (true or false): Put the sidebar on the right side. Defaults to False.

³⁶⁶ https://www.haiku-os.org/docs/userguide/en/contents.html

New in version 1.3: 'alabaster', 'sphinx_rtd_theme' and 'bizstyle' theme.

Changed in version 1.3: The 'default' theme has been renamed to 'classic'. 'default' is still available, however it will emit a notice that it is an alias for the new 'alabaster' theme.

Third Party Themes

There are many third-party themes created for Sphinx. Some of these are for general use, while others are specific to an individual project.

sphinx-themes.org³⁶⁷ is a gallery that showcases various themes for Sphinx, with demo documentation rendered under each theme. Themes can also be found on $PyPI^{368}$ (using the classifier Framework :: Sphinx :: Theme), $GitHub^{369}$ and $GitLab^{370}$.

4.9 Internationalization

New in version 1.1.

Complementary to translations provided for Sphinx-generated messages such as navigation bars, Sphinx provides mechanisms facilitating the translation of *documents*. See the *Options for internationalization* for details on configuration.

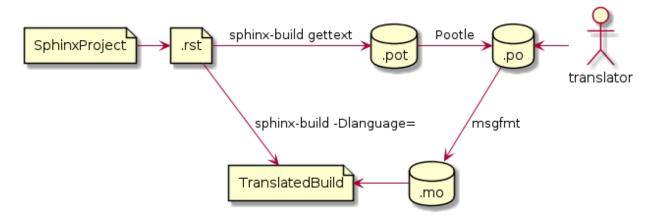

Fig. 1: Workflow visualization of translations in Sphinx. (The figure is created by plantuml Page 227, 371.)

Sphinx internationalization details

gettext¹ is an established standard for internationalization and localization. It naively maps messages in a program to a translated string. Sphinx uses these facilities to translate whole documents.

Initially project maintainers have to collect all translatable strings (also referred to as *messages*) to make them known to translators. Sphinx extracts these through invocation of sphinx-build -M gettext.

Every single element in the doctree will end up in a single message which results in lists being equally split into different chunks while large paragraphs will remain as coarsely-grained as they were in the original document. This grants seamless document updates while still providing a little bit of context for translators in free-text passages. It is the maintainer's task to split up paragraphs which are too large as there is no sane automated way to do that.

After Sphinx successfully ran the <code>MessageCatalogBuilder</code> you will find a collection of .pot files in your output directory. These are <code>catalog templates</code> and contain messages in your original language <code>only</code>.

They can be delivered to translators which will transform them to .po files — so called **message catalogs** — containing a mapping from the original messages to foreign-language strings.

gettext compiles them into a binary format known as **binary catalogs** through **msgfmt** for efficiency reasons. If you make these files discoverable with *locale_dirs* for your *language*, Sphinx will pick them up automatically.

An example: you have a document usage.rst in your Sphinx project. The *gettext* builder will put its messages into usage.pot. Imagine you have Spanish translations² stored in usage.po — for your builds to be translated you need to follow these instructions:

• Compile your message catalog to a locale directory, say locale, so it ends up in ./locale/es/LC_MESSAGES/usage.mo in your source directory (where es is the language code for Spanish.)

```
msgfmt "usage.po" -o "locale/es/LC_MESSAGES/usage.mo"
```

- Set *locale_dirs* to ["locale/"].
- Set *language* to es (also possible via *-D*).
- Run your desired build.

In order to protect against mistakes, a warning is emitted if cross-references in the translated paragraph do not match those from the original. This can be turned off globally using the *suppress_warnings* configuration variable. Alternatively, to turn it off for one message only, end the message with #noqa like this:

```
Lorem ipsum dolor sit amet, consectetur adipiscing elit. Suspendisse risus tortor, luctus id ultrices at. #noqa
```

(Write \#noqa in case you want to have "#noqa" literally in the text. This does not apply to code blocks, where #noqa is ignored because code blocks do not contain references anyway.)

New in version 4.5: The #noqa mechanism.

¹ See the GNU gettext utilities Page 228, 382 for details on that software suite.

 $^{^{382}\} https://www.gnu.org/software/gettext/manual/gettext.html\#Introduction$

² Because nobody expects the Spanish Inquisition!

Translating with sphinx-intl

Quick guide

sphinx-intl³⁷² is a useful tool to work with Sphinx translation flow. This section describe an easy way to translate with *sphinx-intl*.

1. Install sphinx-intl³⁷³.

```
$ pip install sphinx-intl
```

2. Add configurations to conf.py.

```
locale_dirs = ['locale/']  # path is example but recommended.
gettext_compact = False  # optional.
```

This case-study assumes that BUILDDIR is set to _build, <code>locale_dirs</code> is set to <code>locale/</code> and <code>gettext_compact</code> is set to <code>False</code> (the Sphinx document is already configured as such).

3. Extract translatable messages into pot files.

```
$ make gettext
```

The generated pot files will be placed in the _build/gettext directory.

4. Generate po files.

We'll use the pot files generated in the above step.

```
$ sphinx-intl update -p _build/gettext -l de -l ja
```

Once completed, the generated po files will be placed in the below directories:

- ./locale/de/LC_MESSAGES/
- ./locale/ja/LC_MESSAGES/
- 5. Translate po files.

As noted above, these are located in the ./locale/<lamp>/LC_MESSAGES directory. An example of one such file, from Sphinx, builders.po, is given below.

```
# a5600c3d2e3d48fc8c261ea0284db79b
#: ../../builders.rst:4
msgid "Available builders"
msgstr "<FILL HERE BY TARGET LANGUAGE>"
```

Another case, msgid is multi-line text and contains reStructuredText syntax:

```
# 302558364e1d41c69b3277277e34b184
#: ../../builders.rst:9
msgid ""
"These are the built-in Sphinx builders. More builders can be added by "
":ref:`extensions <extensions>`."
msgstr ""
```

(continues on next page)

³⁷² https://pypi.org/project/sphinx-intl/

³⁷³ https://pypi.org/project/sphinx-intl/

(continued from previous page)

```
"FILL HERE BY TARGET LANGUAGE FILL HERE BY TARGET LANGUAGE FILL HERE "
"BY TARGET LANGUAGE :ref:`EXTENSIONS <extensions>` FILL HERE."
```

Please be careful not to break reST notation. Most po-editors will help you with that.

6. Build translated document.

You need a language parameter in conf.py or you may also specify the parameter on the command line.

For BSD/GNU make, run:

```
$ make -e SPHINXOPTS="-D language='de'" html
```

For Windows **cmd.exe**, run:

```
> set SPHINXOPTS=-D language=de
> .\make.bat html
```

For PowerShell, run:

```
> Set-Item env:SPHINXOPTS "-D language=de"
> .\make.bat html
```

Congratulations! You got the translated documentation in the _build/html directory.

New in version 1.3: **sphinx-build** that is invoked by make command will build po files into mo files.

If you are using 1.2.x or earlier, please invoke **sphinx-intl** build command before **make** command.

Translating

Update your po files by new pot files

If a document is updated, it is necessary to generate updated pot files and to apply differences to translated po files. In order to apply the updates from a pot file to the po file, use the **sphinx-intl update** command.

```
$ sphinx-intl update -p _build/gettext
```

Using Transifex service for team translation

Transifex³⁷⁴ is one of several services that allow collaborative translation via a web interface. It has a nifty Python-based command line client that makes it easy to fetch and push translations.

1. Install transifex-client³⁷⁵.

You need **tx** command to upload resources (pot files).

```
$ pip install transifex-client
```

See also:

Transifex Client documentation³⁷⁶

³⁷⁴ https://www.transifex.com/

³⁷⁵ https://pypi.org/project/transifex-client/

³⁷⁶ https://docs.transifex.com/client/introduction/

2. Create your Transifex³⁷⁷ account and create new project for your document.

Currently, Transifex does not allow for a translation project to have more than one version of the document, so you'd better include a version number in your project name.

For example:

```
Project ID
    sphinx-document-test_1_0

Project URL
    https://www.transifex.com/projects/p/sphinx-document-test_1_0/
```

3. Create config files for **tx** command.

This process will create .tx/config in the current directory, as well as a ~/.transifexrc file that includes auth information.

```
$ tx init
Creating .tx folder...
Transifex instance [https://www.transifex.com]:
...
Please enter your transifex username: <transifex-username>
Password: <transifex-password>
...
Done.
```

4. Upload pot files to Transifex service.

Register pot files to .tx/config file:

```
$ cd /your/document/root
$ sphinx-intl update-txconfig-resources --pot-dir _build/locale \
    --transifex-project-name sphinx-document-test_1_0
```

and upload pot files:

```
$ tx push -s
Pushing translations for resource sphinx-document-test_1_0.builders:
Pushing source file (locale/pot/builders.pot)
Resource does not exist. Creating...
...
Done.
```

- 5. Forward the translation on Transifex.
- 6. Pull translated po files and make translated HTML.

Get translated catalogs and build mo files. For example, to build mo files for German (de):

```
$ cd /your/document/root
$ tx pull -l de
Pulling translations for resource sphinx-document-test_1_0.builders (...)
-> de: locale/de/LC_MESSAGES/builders.po
...
Done.
```

Invoke make html (for BSD/GNU make):

³⁷⁷ https://www.transifex.com/

```
$ make -e SPHINXOPTS="-D language='de'" html
```

That's all!

Tip: Translating locally and on Transifex

If you want to push all language's po files, you can be done by using **tx push** -t command. Watch out! This operation overwrites translations in Transifex.

In other words, if you have updated each in the service and local po files, it would take much time and effort to integrate them.

Using Weblate service for team translation

Read more in Weblate's documentation³⁷⁸.

Contributing to Sphinx reference translation

The recommended way for new contributors to translate Sphinx reference is to join the translation team on Transifex.

There is a sphinx translation page³⁷⁹ for Sphinx (master) documentation.

- 1. Login to Transifex³⁸⁰ service.
- 2. Go to sphinx translation page³⁸¹.
- 3. Click Request language and fill form.
- 4. Wait acceptance by Transifex sphinx translation maintainers.
- 5. (After acceptance) Translate on Transifex.

Detail is here: https://docs.transifex.com/getting-started-1/translators

Translation progress and statistics

New in version 7.1.0.

During the rendering process, Sphinx marks each translatable node with a translated attribute, indicating if a translation was found for the text in that node.

The translation_progress_classes configuration value can be used to add a class to each element, depending on the value of the translated attribute.

The |translation progress| substitution can be used to display the percentage of nodes that have been translated on a per-document basis.

³⁷⁸ https://docs.weblate.org/en/latest/devel/sphinx.html

³⁷⁹ https://www.transifex.com/sphinx-doc/sphinx-doc/

³⁸⁰ https://www.transifex.com/

³⁸¹ https://www.transifex.com/sphinx-doc/sphinx-doc/

4.10 Sphinx Web Support

New in version 1.1.

Sphinx provides a Python API to easily integrate Sphinx documentation into your web application. To learn more read the *Web Support Quick Start*.

Web Support Quick Start

Building Documentation Data

To make use of the web support package in your application you'll need to build the data it uses. This data includes pickle files representing documents, search indices, and node data that is used to track where comments and other things are in a document. To do this you will need to create an instance of the <code>WebSupport</code> class and call its <code>build()</code> method:

This will read reStructuredText sources from srcdir and place the necessary data in builddir. The builddir will contain two sub-directories: one named "data" that contains all the data needed to display documents, search through documents, and add comments to documents. The other directory will be called "static" and contains static files that should be served from "/static".

Note: If you wish to serve static files from a path other than "/static", you can do so by providing the *staticdir* keyword argument when creating the *WebSupport* object.

Integrating Sphinx Documents Into Your Webapp

Now that the data is built, it's time to do something useful with it. Start off by creating a *WebSupport* object for your application:

You'll only need one of these for each set of documentation you will be working with. You can then call its <code>get_document()</code> method to access individual documents:

```
contents = support.get_document('contents')
```

This will return a dictionary containing the following items:

- body: The main body of the document as HTML
- sidebar: The sidebar of the document as HTML

- relbar: A div containing links to related documents
- title: The title of the document
- css: Links to CSS files used by Sphinx
- script: JavaScript containing comment options

This dict can then be used as context for templates. The goal is to be easy to integrate with your existing templating system. An example using $Jinja2^{383}$ is:

```
{%- extends "layout.html" %}
{%- block title %}
    {{ document.title }}
{%- endblock %}
{% block css %}
    {{ super() }}
    {{ document.css|safe }}
    <link rel="stylesheet" href="/static/websupport-custom.css" type="text/css">
{% endblock %}
{%- block script %}
    {{ super() }}
    {{ document.script|safe }}
{%- endblock %}
{%- block relbar %}
    {{ document.relbar|safe }}
{%- endblock %}
{%- block body %}
    {{ document.body|safe }}
{%- endblock %}
{%- block sidebar %}
    {{ document.sidebar|safe }}
{%- endblock %}
```

Authentication

To use certain features such as voting, it must be possible to authenticate users. The details of the authentication are left to your application. Once a user has been authenticated you can pass the user's details to certain <code>WebSupport</code> methods using the <code>username</code> and <code>moderator</code> keyword arguments. The web support package will store the username with comments and votes. The only caveat is that if you allow users to change their username you must update the websupport package's data:

```
support.update_username(old_username, new_username)
```

username should be a unique string which identifies a user, and *moderator* should be a boolean representing whether the user has moderation privileges. The default value for *moderator* is False.

³⁸³ https://jinja.palletsprojects.com/

An example Flask³⁸⁴ function that checks whether a user is logged in and then retrieves a document is:

```
from sphinxcontrib.websupport.errors import *

@app.route('/<path:docname>')
def doc(docname):
    username = g.user.name if g.user else ''
    moderator = g.user.moderator if g.user else False
    try:
        document = support.get_document(docname, username, moderator)
    except DocumentNotFoundError:
        abort(404)
    return render_template('doc.html', document=document)
```

The first thing to notice is that the *docname* is just the request path. This makes accessing the correct document easy from a single view. If the user is authenticated, then the username and moderation status are passed along with the docname to <code>get_document()</code>. The web support package will then add this data to the COMMENT_OPTIONS that are used in the template.

Note: This only works if your documentation is served from your document root. If it is served from another directory, you will need to prefix the url route with that directory, and give the *docroot* keyword argument when creating the web support object:

```
support = WebSupport(..., docroot='docs')
@app.route('/docs/<path:docname>')
```

Performing Searches

To use the search form built-in to the Sphinx sidebar, create a function to handle requests to the URL 'search' relative to the documentation root. The user's search query will be in the GET parameters, with the key q. Then use the $get_search_results()$ method to retrieve search results. In Flask³⁸⁵ that would be like this:

```
@app.route('/search')
def search():
    q = request.args.get('q')
    document = support.get_search_results(q)
    return render_template('doc.html', document=document)
```

Note that we used the same template to render our search results as we did to render our documents. That's because $get_search_results()$ returns a context dict in the same format that $get_document()$ does.

³⁸⁴ https://flask.palletsprojects.com/

³⁸⁵ https://flask.palletsprojects.com/

Comments & Proposals

Now that this is done it's time to define the functions that handle the AJAX calls from the script. You will need three functions. The first function is used to add a new comment, and will call the web support method add_comment():

You'll notice that both a parent_id and node_id are sent with the request. If the comment is being attached directly to a node, parent_id will be empty. If the comment is a child of another comment, then node_id will be empty. Then next function handles the retrieval of comments for a specific node, and is aptly named get_data():

```
@app.route('/docs/get_comments')
def get_comments():
    username = g.user.name if g.user else None
    moderator = g.user.moderator if g.user else False
    node_id = request.args.get('node', '')
    data = support.get_data(node_id, username, moderator)
    return jsonify(**data)
```

The final function that is needed will call *process_vote()*, and will handle user votes on comments:

```
@app.route('/docs/process_vote', methods=['POST'])
def process_vote():
    if g.user is None:
        abort(401)
    comment_id = request.form.get('comment_id')
    value = request.form.get('value')
    if value is None or comment_id is None:
        abort(400)
    support.process_vote(comment_id, g.user.id, value)
    return "success"
```

Comment Moderation

By default, all comments added through add_comment() are automatically displayed. If you wish to have some form of moderation, you can pass the displayed keyword argument:

You can then create a new view to handle the moderation of comments. It will be called when a moderator decides a comment should be accepted and displayed:

```
@app.route('/docs/accept_comment', methods=['POST'])
def accept_comment():
    moderator = g.user.moderator if g.user else False
    comment_id = request.form.get('id')
    support.accept_comment(comment_id, moderator=moderator)
    return 'OK'
```

Rejecting comments happens via comment deletion.

To perform a custom action (such as emailing a moderator) when a new comment is added but not displayed, you can pass callable to the *WebSupport* class when instantiating your support object:

```
def moderation_callback(comment):
    """Do something..."""
support = WebSupport(..., moderation_callback=moderation_callback)
```

The moderation callback must take one argument, which will be the same comment dict that is returned by WebSupport.add_comment().

The WebSupport Class

class sphinxcontrib.websupport.WebSupport

The main API class for the web support package. All interactions with the web support package should occur through this class.

The class takes the following keyword arguments:

srcdir

The directory containing reStructuredText source files.

builddir

The directory that build data and static files should be placed in. This should be used when creating a *WebSupport* object that will be used to build data.

datadir

The directory that the web support data is in. This should be used when creating a *WebSupport* object that will be used to retrieve data.

search

This may contain either a string (e.g. 'xapian') referencing a built-in search adapter to use, or an instance of a subclass of *BaseSearch*.

storage

This may contain either a string representing a database uri, or an instance of a subclass of *StorageBackend*. If this is not provided, a new sqlite database will be created.

moderation callback

A callable to be called when a new comment is added that is not displayed. It must accept one argument: a dictionary representing the comment that was added.

staticdir

If the static files should be created in a different location **and not in** '/static', this should be a string with the name of that location (e.g. builddir + '/static_files').

Note: If you specify staticdir, you will typically want to adjust staticroot accordingly.

staticroot

If the static files are not served from '/static', this should be a string with the name of that location (e.g. '/static_files').

docroot

If the documentation is not served from the base path of a URL, this should be a string specifying that path (e.g. 'docs').

Changed in version 1.6: WebSupport class is moved to sphinxcontrib.websupport from sphinx.websupport. Please add sphinxcontrib-websupport package in your dependency and use moved class instead.

Methods

WebSupport.build()

Build the documentation. Places the data into the *outdir* directory. Use it like this:

```
support = WebSupport(srcdir, builddir, search='xapian')
support.build()
```

This will read reStructured text files from *srcdir*. Then it will build the pickles and search index, placing them into *builddir*. It will also save node data to the database.

WebSupport.get_document(docname, username=", moderator=False)

Load and return a document from a pickle. The document will be a dict object which can be used to render a template:

```
support = WebSupport(datadir=datadir)
support.get_document('index', username, moderator)
```

In most cases *docname* will be taken from the request path and passed directly to this function. In Flask, that would be something like this:

The document dict that is returned contains the following items to be used during template rendering.

- body: The main body of the document as HTML
- sidebar: The sidebar of the document as HTML
- relbar: A div containing links to related documents
- title: The title of the document
- css: Links to css files used by Sphinx

• script: Javascript containing comment options

This raises DocumentNotFoundError if a document matching *docname* is not found.

Parameters

docname – the name of the document to load.

WebSupport.get_data(node id, username=None, moderator=False)

Get the comments and source associated with *node_id*. If *username* is given vote information will be included with the returned comments. The default CommentBackend returns a dict with two keys, *source*, and *comments*. *source* is raw source of the node and is used as the starting point for proposals a user can add. *comments* is a list of dicts that represent a comment, each having the following items:

| Key | Contents |
|---------------|---|
| text | The comment text. |
| username | The username that was stored with the comment. |
| id | The comment's unique identifier. |
| rating | The comment's current rating. |
| age | The time in seconds since the comment was added. |
| time | A dict containing time information. It contains the following keys: year, month, day, hour, minute, second, iso, and delta. <i>iso</i> is the time formatted in ISO 8601 format. <i>delta</i> is a printable form of how old the comment is (e.g. "3 hours ago"). |
| vote | If <i>user_id</i> was given, this will be an integer representing the vote. 1 for an upvote, -1 for a downvote, or 0 if unvoted. |
| node | The id of the node that the comment is attached to. If the comment's parent is another comment rather than a node, this will be null. |
| parent | The id of the comment that this comment is attached to if it is not attached to a node. |
| children | A list of all children, in this format. |
| proposal_diff | An HTML representation of the differences between the the current source and the user's proposed source. |

Parameters

- **node_id** the id of the node to get comments for.
- **username** the username of the user viewing the comments.
- **moderator** whether the user is a moderator.

WebSupport.add_comment(text, node_id=", parent_id=", displayed=True, username=None, time=None, proposal=None, moderator=False)

Add a comment to a node or another comment. Returns the comment in the same format as get_comments(). If the comment is being attached to a node, pass in the node's id (as a string) with the node keyword argument:

```
comment = support.add_comment(text, node_id=node_id)
```

If the comment is the child of another comment, provide the parent's id (as a string) with the parent keyword argument:

```
comment = support.add_comment(text, parent_id=parent_id)
```

If you would like to store a username with the comment, pass in the optional username keyword argument:

Parameters

- parent_id the prefixed id of the comment's parent.
- **text** the text of the comment.
- **displayed** for moderation purposes
- username the username of the user making the comment.
- **time** the time the comment was created, defaults to now.

WebSupport.process_vote(comment_id, username, value)

Process a user's vote. The web support package relies on the API user to perform authentication. The API user will typically receive a comment_id and value from a form, and then make sure the user is authenticated. A unique username must be passed in, which will also be used to retrieve the user's past voting data. An example, once again in Flask:

```
@app.route('/docs/process_vote', methods=['POST'])
def process_vote():
    if g.user is None:
        abort(401)
    comment_id = request.form.get('comment_id')
    value = request.form.get('value')
    if value is None or comment_id is None:
        abort(400)
    support.process_vote(comment_id, g.user.name, value)
    return "success"
```

Parameters

- comment_id the comment being voted on
- **username** the unique username of the user voting
- value 1 for an upvote, -1 for a downvote, 0 for an unvote.

WebSupport.get_search_results(q)

Perform a search for the query q, and create a set of search results. Then render the search results as html and return a context dict like the one created by $get_document()$:

```
document = support.get_search_results(q)
```

Parameters

q - the search query

Search Adapters

To create a custom search adapter you will need to subclass the <code>BaseSearch</code> class. Then create an instance of the new class and pass that as the <code>search</code> keyword argument when you create the <code>WebSupport</code> object:

For more information about creating a custom search adapter, please see the documentation of the *BaseSearch* class below.

class sphinxcontrib.websupport.search.BaseSearch

Defines an interface for search adapters.

Changed in version 1.6: BaseSearch class is moved to sphinxcontrib.websupport.search from sphinx.websupport.search.

Methods

The following methods are defined in the BaseSearch class. Some methods do not need to be overridden, but some (add_document() and handle_query()) must be overridden in your subclass. For a working example, look at the built-in adapter for whoosh.

BaseSearch.init_indexing(changed=[])

Called by the builder to initialize the search indexer. *changed* is a list of pagenames that will be reindexed. You may want to remove these from the search index before indexing begins.

Parameters

changed – a list of pagenames that will be re-indexed

BaseSearch.finish_indexing()

Called by the builder when writing has been completed. Use this to perform any finalization or cleanup actions after indexing is complete.

BaseSearch. **feed**(pagename, filename, title, doctree)

Called by the builder to add a doctree to the index. Converts the *doctree* to text and passes it to *add_document()*. You probably won't want to override this unless you need access to the *doctree*. Override *add_document()* instead.

Parameters

- pagename the name of the page to be indexed
- **filename** the name of the original source file
- **title** the title of the page to be indexed
- **doctree** is the docutils doctree representation of the page

BaseSearch.add_document(pagename, filename, title, text)

Called by *feed()* to add a document to the search index. This method should should do everything necessary to add a single document to the search index.

pagename is name of the page being indexed. It is the combination of the source files relative path and filename, minus the extension. For example, if the source file is "ext/builders.rst", the *pagename* would be "ext/builders". This will need to be returned with search results when processing a query.

Parameters

- pagename the name of the page being indexed
- **filename** the name of the original source file
- **title** the page's title
- **text** the full text of the page

BaseSearch.query(q)

Called by the web support api to get search results. This method compiles the regular expression to be used when extracting context, then calls handle_query(). You won't want to override this unless you don't want to use the included extract_context() method. Override handle_query() instead.

Parameters

q – the search query string.

BaseSearch.handle_query(q)

Called by query() to retrieve search results for a search query q. This should return an iterable containing tuples of the following format:

```
(<path>, <title>, <context>)
```

path and title are the same values that were passed to add_document(), and context should be a short text snippet of the text surrounding the search query in the document.

The <code>extract_context()</code> method is provided as a simple way to create the <code>context</code>.

Parameters

q – the search query

BaseSearch.extract_context(text, length=240)

Extract the context for the search query from the document's full *text*.

Parameters

- **text** the full text of the document to create the context for
- **length** the length of the context snippet to return.

Storage Backends

To create a custom storage backend you will need to subclass the *StorageBackend* class. Then create an instance of the new class and pass that as the *storage* keyword argument when you create the *WebSupport* object:

For more information about creating a custom storage backend, please see the documentation of the *StorageBackend* class below.

class sphinxcontrib.websupport.storage.StorageBackend

Defines an interface for storage backends.

Changed in version 1.6: StorageBackend class is moved to sphinxcontrib.websupport.storage from sphinx.websupport.storage.

Methods

StorageBackend.pre_build()

Called immediately before the build process begins. Use this to prepare the StorageBackend for the addition of nodes.

StorageBackend.add_node(id, document, source)

Add a node to the StorageBackend.

Parameters

- id a unique id for the comment.
- **document** the name of the document the node belongs to.
- **source** the source files name.

StorageBackend.post_build()

Called after a build has completed. Use this to finalize the addition of nodes if needed.

StorageBackend.add_comment(text, displayed, username, time, proposal, node_id, parent_id, moderator)

Called when a comment is being added.

Parameters

- **text** the text of the comment
- **displayed** whether the comment should be displayed
- username the name of the user adding the comment
- time a date object with the time the comment was added
- **proposal** the text of the proposal the user made
- **node_id** the id of the node that the comment is being added to
- parent_id the id of the comment's parent comment.
- **moderator** whether the user adding the comment is a moderator

StorageBackend.delete_comment(comment_id, username, moderator)

Delete a comment.

Raises UserNotAuthorizedError if moderator is False and *username* doesn't match the username on the comment.

Parameters

- **comment_id** The id of the comment being deleted.
- **username** The username of the user requesting the deletion.
- **moderator** Whether the user is a moderator.

StorageBackend.get_data(node_id, username, moderator)

Called to retrieve all data for a node. This should return a dict with two keys, *source* and *comments* as described by *WebSupport*'s *get_data()* method.

Parameters

- **node_id** The id of the node to get data for.
- **username** The name of the user requesting the data.
- **moderator** Whether the requestor is a moderator.

StorageBackend.process_vote(comment_id, username, value)

Process a vote that is being cast. *value* will be either -1, 0, or 1.

Parameters

- **comment_id** The id of the comment being voted on.
- **username** The username of the user casting the vote.
- value The value of the vote being cast.

StorageBackend.update_username(old_username, new_username)

If a user is allowed to change their username this method should be called so that there is not stagnate data in the storage system.

Parameters

- **old_username** The username being changed.
- **new_username** What the username is being changed to.

StorageBackend.accept_comment(comment_id)

Called when a moderator accepts a comment. After the method is called the comment should be displayed to all users.

Parameters

comment_id – The id of the comment being accepted.

CHAPTER

FIVE

WRITING SPHINX EXTENSIONS

This guide is aimed at giving a quick introduction for those wishing to develop their own extensions for Sphinx. Sphinx possesses significant extensibility capabilities including the ability to hook into almost every point of the build process. If you simply wish to use Sphinx with existing extensions, refer to *Using Sphinx*. For a more detailed discussion of the extension interface see *Sphinx Extensions API*.

5.1 Developing extensions overview

This page contains general information about developing Sphinx extensions.

Make an extension depend on another extension

Sometimes your extension depends on the functionality of another Sphinx extension. Most Sphinx extensions are activated in a project's conf.py file, but this is not available to you as an extension developer.

To ensure that another extension is activated as a part of your own extension, use the *sphinx.application.Sphinx.setup_extension()* method. This will activate another extension at run-time, ensuring that you have access to its functionality.

For example, the following code activates the recommonmark extension:

```
def setup(app):
    app.setup_extension("recommonmark")
```

Note: Since your extension will depend on another, make sure to include it as a part of your extension's installation requirements.

5.2 Extension tutorials

Refer to the following tutorials to get started with extension development.

Developing a "Hello world" extension

The objective of this tutorial is to create a very basic extension that adds a new directive. This directive will output a paragraph containing "hello world".

Only basic information is provided in this tutorial. For more information, refer to the *other tutorials* that go into more details.

Warning: For this extension, you will need some basic understanding of docutils³⁸⁶ and Python.

Overview

We want the extension to add the following to Sphinx:

• A helloworld directive, that will simply output the text "hello world".

Prerequisites

We will not be distributing this plugin via PyPI³⁸⁷ and will instead include it as part of an existing project. This means you will need to use an existing project or create a new one using **sphinx-quickstart**.

We assume you are using separate source (source) and build (build) folders. Your extension file could be in any folder of your project. In our case, let's do the following:

- 1. Create an _ext folder in source
- 2. Create a new Python file in the _ext folder called helloworld.py

Here is an example of the folder structure you might obtain:

Writing the extension

Open helloworld.py and paste the following code in it:

```
from docutils import nodes
from docutils.parsers.rst import Directive

class HelloWorld(Directive):

(continues on next page)
```

³⁸⁶ https://docutils.sourceforge.io/

³⁸⁷ https://pypi.org/

```
def run(self):
            paragraph_node = nodes.paragraph(text='Hello World!')
            return [paragraph_node]
9
11
12
   def setup(app):
       app.add_directive("helloworld", HelloWorld)
13
14
       return {
15
            'version': '0.1',
16
            'parallel_read_safe': True,
17
            'parallel_write_safe': True,
18
       }
```

Some essential things are happening in this example, and you will see them for all directives.

The directive class

Our new directive is declared in the HelloWorld class.

```
class HelloWorld(Directive):

def rum(self):
    paragraph_node = nodes.paragraph(text='Hello World!')
    return [paragraph_node]
```

This class extends the docutils³⁸⁸, Directive class. All extensions that create directives should extend this class.

See also:

The docutils documentation on creating directives³⁸⁹

This class contains a run method. This method is a requirement and it is part of every directive. It contains the main logic of the directive and it returns a list of docutils nodes to be processed by Sphinx. These nodes are docutils' way of representing the content of a document. There are many types of nodes available: text, paragraph, reference, table, etc.

See also:

The docutils documentation on nodes³⁹⁰

The nodes.paragraph class creates a new paragraph node. A paragraph node typically contains some text that we can set during instantiation using the text parameter.

5.2. Extension tutorials

³⁸⁸ https://docutils.sourceforge.io/

³⁸⁹ https://docutils.sourceforge.io/docs/howto/rst-directives.html

³⁹⁰ https://docutils.sourceforge.io/docs/ref/doctree.html

The setup function

This function is a requirement. We use it to plug our new directive into Sphinx.

```
def setup(app):
    app.add_directive("helloworld", HelloWorld)

return {
    'version': '0.1',
    'parallel_read_safe': True,
    'parallel_write_safe': True,
}
```

The simplest thing you can do is to call the *add_directive()* method, which is what we've done here. For this particular call, the first argument is the name of the directive itself as used in a reST file. In this case, we would use helloworld. For example:

```
Some intro text here...

.. helloworld::
Some more text here...
```

We also return the *extension metadata* that indicates the version of our extension, along with the fact that it is safe to use the extension for both parallel reading and writing.

Using the extension

The extension has to be declared in your conf.py file to make Sphinx aware of it. There are two steps necessary here:

- 1. Add the _ext directory to the Python path³⁹¹ using sys.path.append. This should be placed at the top of the file.
- 2. Update or create the extensions list and add the extension file name to the list

For example:

```
import os
import sys

sys.path.append(os.path.abspath("./_ext"))

extensions = ['helloworld']
```

Tip: We're not distributing this extension as a Python package³⁹², we need to modify the Python path³⁹³ so Sphinx can find our extension. This is why we need the call to sys.path.append.

You can now use the extension in a file. For example:

³⁹¹ https://docs.python.org/3/using/cmdline.html#envvar-PYTHONPATH

³⁹² https://packaging.python.org/

³⁹³ https://docs.python.org/3/using/cmdline.html#envvar-PYTHONPATH

249

```
Some intro text here...

.. helloworld::

Some more text here...
```

The sample above would generate:

```
Some intro text here...

Hello World!

Some more text here...
```

Further reading

This is the very basic principle of an extension that creates a new directive.

For a more advanced example, refer to Developing a "TODO" extension.

Developing a "TODO" extension

The objective of this tutorial is to create a more comprehensive extension than that created in *Developing a "Hello world" extension*. Whereas that guide just covered writing a custom *directive*, this guide adds multiple directives, along with custom nodes, additional config values and custom event handlers. To this end, we will cover a todo extension that adds capabilities to include todo entries in the documentation, and to collect these in a central place. This is similar the sphinxext.todo extension distributed with Sphinx.

Overview

Note: To understand the design of this extension, refer to Important objects and Build Phases.

We want the extension to add the following to Sphinx:

- A todo directive, containing some content that is marked with "TODO" and only shown in the output if a new config value is set. Todo entries should not be in the output by default.
- A todolist directive that creates a list of all todo entries throughout the documentation.

For that, we will need to add the following elements to Sphinx:

- New directives, called todo and todolist.
- New document tree nodes to represent these directives, conventionally also called todo and todolist. We
 wouldn't need new nodes if the new directives only produced some content representable by existing nodes.
- A new config value todo_include_todos (config value names should start with the extension name, in order to stay unique) that controls whether todo entries make it into the output.
- New event handlers: one for the *doctree-resolved* event, to replace the todo and todolist nodes, one for *env-merge-info* to merge intermediate results from parallel builds, and one for *env-purge-doc* (the reason for that will be covered later).

5.2. Extension tutorials

Prerequisites

As with *Developing a "Hello world" extension*, we will not be distributing this plugin via PyPI so once again we need a Sphinx project to call this from. You can use an existing project or create a new one using **sphinx-quickstart**.

We assume you are using separate source (source) and build (build) folders. Your extension file could be in any folder of your project. In our case, let's do the following:

- 1. Create an _ext folder in source
- 2. Create a new Python file in the _ext folder called todo.py

Here is an example of the folder structure you might obtain:

Writing the extension

Open todo.py and paste the following code in it, all of which we will explain in detail shortly:

```
from docutils import nodes
   from docutils.parsers.rst import Directive
   from sphinx.locale import _
   from sphinx.util.docutils import SphinxDirective
   class todo(nodes.Admonition, nodes.Element):
       pass
10
   class todolist(nodes.General, nodes.Element):
12
       pass
13
14
15
   def visit_todo_node(self, node):
16
       self.visit_admonition(node)
17
18
19
   def depart_todo_node(self, node):
20
        self.depart_admonition(node)
21
22
23
   class TodolistDirective(Directive):
24
25
       def run(self):
```

(continues on next page)

250

```
return [todolist('')]
27
29
   class TodoDirective(SphinxDirective):
31
       # this enables content in the directive
32
       has content = True
33
       def run(self):
35
           targetid = 'todo-%d' % self.env.new_serialno('todo')
36
           targetnode = nodes.target('', '', ids=[targetid])
37
38
           todo_node = todo('\n'.join(self.content))
           todo_node += nodes.title(_('Todo'), _('Todo'))
40
           self.state.nested_parse(self.content, self.content_offset, todo_node)
41
42.
           if not hasattr(self.env, 'todo_all_todos'):
                self.env.todo_all_todos = []
44
           self.env.todo_all_todos.append({
46
                'docname': self.env.docname,
                'lineno': self.lineno,
48
                'todo': todo_node.deepcopy(),
                'target': targetnode,
           })
51
52
           return [targetnode, todo_node]
53
54
55
   def purge_todos(app, env, docname):
56
       if not hasattr(env, 'todo_all_todos'):
57
           return
59
       env.todo_all_todos = [todo for todo in env.todo_all_todos
                              if todo['docname'] != docname]
63
   def merge_todos(app, env, docnames, other):
       if not hasattr(env, 'todo_all_todos'):
65
           env.todo_all_todos = []
       if hasattr(other, 'todo_all_todos'):
67
           env.todo_all_todos.extend(other.todo_all_todos)
   def process_todo_nodes(app, doctree, fromdocname):
71
       if not app.config.todo_include_todos:
72
           for node in doctree.findall(todo):
                node.parent.remove(node)
74
       # Replace all todolist nodes with a list of the collected todos.
76
       # Augment each todo with a backlink to the original location.
77
       env = app.builder.env
```

(continues on next page)

```
if not hasattr(env, 'todo_all_todos'):
            env.todo_all_todos = []
81
        for node in doctree findall(todolist):
83
            if not app.config.todo_include_todos:
                node.replace_self([])
85
                continue
            content = []
88
            for todo_info in env.todo_all_todos:
                para = nodes.paragraph()
                filename = env.doc2path(todo_info['docname'], base=None)
92
                description = (
                     _('(The original entry is located in %s, line %d and can be found ') %
                     (filename, todo_info['lineno']))
                para += nodes.Text(description)
                # Create a reference
                newnode = nodes.reference('', '')
                innernode = nodes.emphasis(_('here'), _('here'))
100
                newnode['refdocname'] = todo_info['docname']
101
                newnode['refuri'] = app.builder.get_relative_uri(
102
                     fromdocname, todo_info['docname'])
103
                newnode['refuri'] += '#' + todo_info['target']['refid']
104
                newnode.append(innernode)
105
                para += newnode
                para += nodes.Text('.)')
107
108
                # Insert into the todolist
109
                content.extend((
                     todo_info['todo'],
111
                     para,
112
                ))
113
            node.replace_self(content)
115
117
   def setup(app):
118
        app.add_config_value('todo_include_todos', False, 'html')
119
120
        app.add_node(todolist)
121
        app.add_node(todo,
122
                      html=(visit_todo_node, depart_todo_node),
123
                      latex=(visit_todo_node, depart_todo_node),
124
                      text=(visit_todo_node, depart_todo_node))
126
        app.add_directive('todo', TodoDirective)
127
        app.add_directive('todolist', TodolistDirective)
128
        app.connect('doctree-resolved', process_todo_nodes)
        app.connect('env-purge-doc', purge_todos)
130
```

(continues on next page)

```
app.connect('env-merge-info', merge_todos)

return {
    'version': '0.1',
    'parallel_read_safe': True,
    'parallel_write_safe': True,
}
```

This is far more extensive extension than the one detailed in *Developing a "Hello world" extension*, however, we will will look at each piece step-by-step to explain what's happening.

The node classes

Let's start with the node classes:

```
class todo(nodes.Admonition, nodes.Element):
    pass

class todolist(nodes.General, nodes.Element):
    pass

def visit_todo_node(self, node):
    self.visit_admonition(node)

def depart_todo_node(self, node):
    self.depart_admonition(node)
```

Node classes usually don't have to do anything except inherit from the standard docutils classes defined in docutils. nodes. todo inherits from Admonition because it should be handled like a note or warning, todolist is just a "general" node.

Note: Many extensions will not have to create their own node classes and work fine with the nodes already provided by docutils³⁹⁴ and *Sphinx*.

Attention: It is important to know that while you can extend Sphinx without leaving your conf.py, if you declare an inherited node right there, you'll hit an unobvious PickleError³⁹⁵. So if something goes wrong, please make sure that you put inherited nodes into a separate Python module.

For more details, see:

- https://github.com/sphinx-doc/sphinx/issues/6751
- https://github.com/sphinx-doc/sphinx/issues/1493
- https://github.com/sphinx-doc/sphinx/issues/1424

³⁹⁵ https://docs.python.org/3/library/pickle.html#pickle.PickleError

The directive classes

A directive class is a class deriving usually from *docutils.parsers.rst.Directive*. The directive interface is also covered in detail in the docutils documentation³⁹⁶; the important thing is that the class should have attributes that configure the allowed markup, and a run method that returns a list of nodes.

Looking first at the TodolistDirective directive:

```
class TodolistDirective(Directive):

def run(self):
    return [todolist('')]
```

It's very simple, creating and returning an instance of our todolist node class. The TodolistDirective directive itself has neither content nor arguments that need to be handled. That brings us to the TodoDirective directive:

```
class TodoDirective(SphinxDirective):
2
       # this enables content in the directive
       has_content = True
4
       def run(self):
6
           targetid = 'todo-%d' % self.env.new_serialno('todo')
           targetnode = nodes.target('', '', ids=[targetid])
8
           todo_node = todo('\n'.join(self.content))
10
           todo_node += nodes.title(_('Todo'), _('Todo'))
           self.state.nested_parse(self.content, self.content_offset, todo_node)
12
           if not hasattr(self.env, 'todo_all_todos'):
14
                self.env.todo_all_todos = []
15
16
           self.env.todo_all_todos.append({
17
                'docname': self.env.docname,
                'lineno': self.lineno,
19
                'todo': todo_node.deepcopy(),
20
                'target': targetnode,
21
           })
23
           return [targetnode, todo_node]
```

Several important things are covered here. First, as you can see, we're now subclassing the *SphinxDirective* helper class instead of the usual *Directive* class. This gives us access to the *build environment instance* using the self.env property. Without this, we'd have to use the rather convoluted self.state.document.settings.env. Then, to act as a link target (from TodolistDirective), the TodoDirective directive needs to return a target node in addition to the todo node. The target ID (in HTML, this will be the anchor name) is generated by using env.new_serialno which returns a new unique integer on each call and therefore leads to unique target names. The target node is instantiated without any text (the first two arguments).

On creating admonition node, the content body of the directive are parsed using self.state.nested_parse. The first argument gives the content body, and the second one gives content offset. The third argument gives the parent node of parsed result, in our case the todo node. Following this, the todo node is added to the environment. This is needed to be able to create a list of all todo entries throughout the documentation, in the place where the author puts a todolist directive. For this case, the environment attribute todo_all_todos is used (again, the name should be

³⁹⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html

unique, so it is prefixed by the extension name). It does not exist when a new environment is created, so the directive must check and create it if necessary. Various information about the todo entry's location are stored along with a copy of the node.

In the last line, the nodes that should be put into the doctree are returned: the target node and the admonition node.

The node structure that the directive returns looks like this:

The event handlers

Event handlers are one of Sphinx's most powerful features, providing a way to do hook into any part of the documentation process. There are many events provided by Sphinx itself, as detailed in *the API guide*, and we're going to use a subset of them here.

Let's look at the event handlers used in the above example. First, the one for the *env-purge-doc* event:

Since we store information from source files in the environment, which is persistent, it may become out of date when the source file changes. Therefore, before each source file is read, the environment's records of it are cleared, and the <code>env-purge-doc</code> event gives extensions a chance to do the same. Here we clear out all todos whose docname matches the given one from the todo_all_todos list. If there are todos left in the document, they will be added again during parsing.

The next handler, for the *env-merge-info* event, is used during parallel builds. As during parallel builds all threads have their own env, there's multiple todo_all_todos lists that need to be merged:

```
def merge_todos(app, env, docnames, other):
    if not hasattr(env, 'todo_all_todos'):
        env.todo_all_todos = []
    if hasattr(other, 'todo_all_todos'):
        env.todo_all_todos.extend(other.todo_all_todos)
```

The other handler belongs to the *doctree-resolved* event:

```
def process_todo_nodes(app, doctree, fromdocname):
       if not app.config.todo_include_todos:
           for node in doctree.findall(todo):
                node.parent.remove(node)
       # Replace all todolist nodes with a list of the collected todos.
6
       # Augment each todo with a backlink to the original location.
       env = app.builder.env
       if not hasattr(env, 'todo_all_todos'):
10
           env.todo_all_todos = []
12
       for node in doctree.findall(todolist):
13
           if not app.config.todo_include_todos:
14
                node.replace_self([])
                continue
16
           content = []
18
19
           for todo_info in env.todo_all_todos:
20
                para = nodes.paragraph()
21
                filename = env.doc2path(todo_info['docname'], base=None)
22
                description = (
23
                    _('(The original entry is located in %s, line %d and can be found ') %
24
                    (filename, todo_info['lineno']))
25
                para += nodes.Text(description)
27
                # Create a reference
                newnode = nodes.reference('', '')
29
                innernode = nodes.emphasis(_('here'), _('here'))
                newnode['refdocname'] = todo_info['docname']
31
                newnode['refuri'] = app.builder.get_relative_uri(
                    fromdocname, todo_info['docname'])
33
                newnode['refuri'] += '#' + todo_info['target']['refid']
                newnode append(innernode)
35
                para += newnode
                para += nodes.Text('.)')
37
38
                # Insert into the todolist
39
                content.extend((
                    todo_info['todo'],
41
                    para,
42.
                ))
43
```

The doctree-resolved event is emitted at the end of phase 3 (resolving) and allows custom resolving to be done. The handler we have written for this event is a bit more involved. If the todo_include_todos config value (which we'll describe shortly) is false, all todo and todolist nodes are removed from the documents. If not, todo nodes just stay where and how they are. todolist nodes are replaced by a list of todo entries, complete with backlinks to the location where they come from. The list items are composed of the nodes from the todo entry and docutils nodes created on the fly: a paragraph for each entry, containing text that gives the location, and a link (reference node containing an italic node) with the backreference. The reference URI is built by sphinx.builders.Builder.get_relative_uri() which creates a suitable URI depending on the used builder, and appending the todo node's (the target's) ID as the anchor name.

257

The setup function

As noted *previously*, the setup function is a requirement and is used to plug directives into Sphinx. However, we also use it to hook up the other parts of our extension. Let's look at our setup function:

```
2
   def setup(app):
       app.add_config_value('todo_include_todos', False, 'html')
       app.add_node(todolist)
6
       app.add_node(todo,
                     html=(visit_todo_node, depart_todo_node),
                     latex=(visit_todo_node, depart_todo_node),
                     text=(visit_todo_node, depart_todo_node))
10
11
       app.add_directive('todo', TodoDirective)
12
       app.add_directive('todolist', TodolistDirective)
13
       app.connect('doctree-resolved', process_todo_nodes)
14
       app.connect('env-purge-doc', purge_todos)
15
       app.connect('env-merge-info', merge_todos)
17
       return {
           'version': '0.1',
           'parallel_read_safe': True,
            'parallel_write_safe': True,
21
       }
```

The calls in this function refer to the classes and functions we added earlier. What the individual calls do is the following:

• add_config_value() lets Sphinx know that it should recognize the new config value todo_include_todos, whose default value should be False (this also tells Sphinx that it is a boolean value).

If the third argument was 'html', HTML documents would be full rebuild if the config value changed its value. This is needed for config values that influence reading (build *phase 1 (reading)*).

- add_node() adds a new node class to the build system. It also can specify visitor functions for each supported output format. These visitor functions are needed when the new nodes stay until phase 4 (writing). Since the todolist node is always replaced in phase 3 (resolving), it doesn't need any.
- add_directive() adds a new directive, given by name and class.
- Finally, *connect()* adds an *event handler* to the event whose name is given by the first argument. The event handler function is called with several arguments which are documented with the event.

With this, our extension is complete.

Using the extension

As before, we need to enable the extension by declaring it in our conf.py file. There are two steps necessary here:

- 1. Add the _ext directory to the Python path³⁹⁷ using sys.path.append. This should be placed at the top of the file.
- 2. Update or create the extensions list and add the extension file name to the list

In addition, we may wish to set the todo_include_todos config value. As noted above, this defaults to False but we can set it explicitly.

For example:

```
import os
import sys

sys.path.append(os.path.abspath("./_ext"))

extensions = ['todo']

todo_include_todos = False
```

You can now use the extension throughout your project. For example:

Listing 1: index.rst

```
Hello, world
==========

.. toctree::
    somefile.rst
    someotherfile.rst

Hello world. Below is the list of TODOs.
.. todolist::
```

Listing 2: somefile.rst

```
foo
===
Some intro text here...
.. todo:: Fix this
```

Listing 3: someotherfile.rst

```
bar ===

Some more text here... (continues on next page)
```

³⁹⁷ https://docs.python.org/3/using/cmdline.html#envvar-PYTHONPATH

```
.. todo:: Fix that
```

Because we have configured todo_include_todos to False, we won't actually see anything rendered for the todo and todolist directives. However, if we toggle this to true, we will see the output described previously.

Further reading

For more information, refer to the docutils³⁹⁸ documentation and *Sphinx Extensions API*.

Developing a "recipe" extension

The objective of this tutorial is to illustrate roles, directives and domains. Once complete, we will be able to use this extension to describe a recipe and reference that recipe from elsewhere in our documentation.

Note: This tutorial is based on a guide first published on opensource.com³⁹⁹ and is provided here with the original author's permission.

Overview

We want the extension to add the following to Sphinx:

- A recipe *directive*, containing some content describing the recipe steps, along with a :contains: option highlighting the main ingredients of the recipe.
- A ref role, which provides a cross-reference to the recipe itself.
- A recipe *domain*, which allows us to tie together the above role and domain, along with things like indices.

For that, we will need to add the following elements to Sphinx:

- A new directive called recipe
- New indexes to allow us to reference ingredient and recipes
- A new domain called recipe, which will contain the recipe directive and ref role

Prerequisites

We need the same setup as in *the previous extensions*. This time, we will be putting out extension in a file called recipe.py.

Here is an example of the folder structure you might obtain:

```
source
—__ext
___recipe.py
—_conf.py
—_index.rst
```

5.2. Extension tutorials 259

³⁹⁸ https://docutils.sourceforge.io/docs/

³⁹⁹ https://opensource.com/article/18/11/building-custom-workflows-sphinx

Writing the extension

Open recipe.py and paste the following code in it, all of which we will explain in detail shortly:

```
from collections import defaultdict
   from docutils.parsers.rst import directives
   from sphinx import addnodes
   from sphinx.directives import ObjectDescription
   from sphinx.domains import Domain, Index
   from sphinx.roles import XRefRole
   from sphinx.util.nodes import make_refnode
10
11
   class RecipeDirective(ObjectDescription):
12
        """A custom directive that describes a recipe."""
13
14
       has_content = True
       required_arguments = 1
16
       option_spec = {
            'contains': directives.unchanged_required,
18
       }
20
       def handle_signature(self, sig, signode):
21
           signode += addnodes.desc_name(text=sig)
22
           return sig
24
       def add_target_and_index(self, name_cls, sig, signode):
25
           signode['ids'].append('recipe' + '-' + sig)
26
           if 'contains' in self.options:
27
                ingredients = [
                    x.strip() for x in self.options.get('contains').split(',')]
29
30
                recipes = self.env.get_domain('recipe')
31
                recipes add_recipe(sig, ingredients)
33
   class IngredientIndex(Index):
35
        """A custom index that creates an ingredient matrix."""
37
       name = 'ingredient'
       localname = 'Ingredient Index'
39
       shortname = 'Ingredient'
41
       def generate(self, docnames=None):
           content = defaultdict(list)
43
44
           recipes = {name: (dispname, typ, docname, anchor)
45
                       for name, dispname, typ, docname, anchor, _
                       in self.domain.get_objects()}
47
           recipe_ingredients = self.domain.data['recipe_ingredients']
48
           ingredient_recipes = defaultdict(list)
```

(continues on next page)

```
50
            # flip from recipe_ingredients to ingredient_recipes
51
            for recipe_name, ingredients in recipe_ingredients.items():
52
                for ingredient in ingredients:
                    ingredient_recipes[ingredient].append(recipe_name)
54
55
            # convert the mapping of ingredient to recipes to produce the expected
56
            # output, shown below, using the ingredient name as a key to group
57
58
            # name, subtype, docname, anchor, extra, qualifier, description
            for ingredient, recipe_names in ingredient_recipes.items():
60
                for recipe_name in recipe_names:
61
                    dispname, typ, docname, anchor = recipes[recipe_name]
                    content[ingredient].append(
63
                         (dispname, 0, docname, anchor, docname, '', typ))
65
            # convert the dict to the sorted list of tuples expected
            content = sorted(content.items())
67
            return content, True
69
71
   class RecipeIndex(Index):
72
        """A custom index that creates an recipe matrix."""
73
74
       name = 'recipe'
75
        localname = 'Recipe Index'
76
        shortname = 'Recipe'
77
78
        def generate(self, docnames=None):
            content = defaultdict(list)
80
81
            # sort the list of recipes in alphabetical order
82
            recipes = self.domain.get_objects()
            recipes = sorted(recipes, key=lambda recipe: recipe[0])
84
            # generate the expected output, shown below, from the above using the
86
            # first letter of the recipe as a key to group thing
88
            # name, subtype, docname, anchor, extra, qualifier, description
            for _name, dispname, typ, docname, anchor, _priority in recipes:
90
                content[dispname[0].lower()].append(
                    (dispname, 0, docname, anchor, docname, '', typ))
92
93
            # convert the dict to the sorted list of tuples expected
94
            content = sorted(content.items())
95
           return content, True
97
   class RecipeDomain(Domain):
100
101
```

(continues on next page)

```
name = 'recipe'
102
        label = 'Recipe Sample'
        roles = {
104
             'ref': XRefRole(),
        }
106
        directives = {
107
             'recipe': RecipeDirective,
108
109
        indices = {

128
129
                       in self.get_objects() if sig == target]
130
            if len(match) > 0:
131
                 todocname = match[0][0]
                 targ = match[0][1]
134
                 return make_refnode(builder, fromdocname, todocname, targ,
135
                                       contnode, targ)
136
             else.
                 print('Awww, found nothing')
138
                 return None
140
        def add_recipe(self, signature, ingredients):
141
             """Add a new recipe to the domain."""
142
            name = f'recipe.{signature}'
143
             anchor = f'recipe-{signature}'
145
             self.data['recipe_ingredients'][name] = ingredients
146
             # name, dispname, type, docname, anchor, priority
147
             self.data['recipes'].append(
148
                 (name, signature, 'Recipe', self.env.docname, anchor, 0))
149
150
151
    def setup(app):
152
        app.add_domain(RecipeDomain)
153
```

```
return {
    'version': '0.1',
    'parallel_read_safe': True,
    'parallel_write_safe': True,
}
```

Let's look at each piece of this extension step-by-step to explain what's going on.

The directive class

The first thing to examine is the RecipeDirective directive:

```
class RecipeDirective(ObjectDescription):
       """A custom directive that describes a recipe."""
2
       has_content = True
4
       required_arguments = 1
       option_spec = {
6
            'contains': directives.unchanged_required,
       }
       def handle_signature(self, sig, signode):
10
           signode += addnodes.desc_name(text=sig)
           return sig
12
       def add_target_and_index(self, name_cls, sig, signode):
14
           signode['ids'].append('recipe' + '-' + sig)
15
           if 'contains' in self.options:
16
                ingredients = [
17
                    x.strip() for x in self.options.get('contains').split(',')]
19
                recipes = self.env.get_domain('recipe')
20
                recipes.add_recipe(sig, ingredients)
21
```

Unlike Developing a "Hello world" extension and Developing a "TODO" extension, this directive doesn't derive from docutils.parsers.rst.Directive and doesn't define a run method. Instead, it derives from sphinx. directives.ObjectDescription and defines handle_signature and add_target_and_index methods. This is because ObjectDescription is a special-purpose directive that's intended for describing things like classes, functions, or, in our case, recipes. More specifically, handle_signature implements parsing the signature of the directive and passes on the object's name and type to its superclass, while add_target_and_index adds a target (to link to) and an entry to the index for this node.

We also see that this directive defines has_content, required_arguments and option_spec. Unlike the TodoDirective directive added in the *previous tutorial*, this directive takes a single argument, the recipe name, and an option, contains, in addition to the nested reStructuredText in the body.

5.2. Extension tutorials

The index classes

Todo: Add brief overview of indices

```
class IngredientIndex(Index):
       """A custom index that creates an ingredient matrix."""
       name = 'ingredient'
       localname = 'Ingredient Index'
       shortname = 'Ingredient'
       def generate(self, docnames=None):
8
           content = defaultdict(list)
10
           recipes = {name: (dispname, typ, docname, anchor)
11
                       for name, dispname, typ, docname, anchor, _
12
                       in self.domain.get_objects()}
13
           recipe_ingredients = self.domain.data['recipe_ingredients']
14
           ingredient_recipes = defaultdict(list)
16
           # flip from recipe_ingredients to ingredient_recipes
           for recipe_name, ingredients in recipe_ingredients.items():
18
               for ingredient in ingredients:
19
                    ingredient_recipes[ingredient].append(recipe_name)
20
           # convert the mapping of ingredient to recipes to produce the expected
22
           # output, shown below, using the ingredient name as a key to group
23
24
           # name, subtype, docname, anchor, extra, qualifier, description
25
           for ingredient, recipe_names in ingredient_recipes.items():
26
               for recipe_name in recipe_names:
27
                    dispname, typ, docname, anchor = recipes[recipe_name]
28
                    content[ingredient].append(
29
                        (dispname, 0, docname, anchor, docname, '', typ))
31
           # convert the dict to the sorted list of tuples expected
           content = sorted(content.items())
33
34
           return content, True
35
```

```
class RecipeIndex(Index):
    """A custom index that creates an recipe matrix."""

name = 'recipe'
localname = 'Recipe Index'
shortname = 'Recipe'

def generate(self, docnames=None):
    content = defaultdict(list)

# sort the list of recipes in alphabetical order
```

(continues on next page)

```
recipes = self.domain.get_objects()
12
           recipes = sorted(recipes, key=lambda recipe: recipe[0])
13
14
           # generate the expected output, shown below, from the above using the
           # first letter of the recipe as a key to group thing
16
           # name, subtype, docname, anchor, extra, qualifier, description
18
           for _name, dispname, typ, docname, anchor, _priority in recipes:
19
               content[dispname[0].lower()].append(
20
                    (dispname, 0, docname, anchor, docname, '', typ))
21
22
           # convert the dict to the sorted list of tuples expected
23
           content = sorted(content.items())
25
           return content, True
```

Both IngredientIndex and RecipeIndex are derived from *Index*. They implement custom logic to generate a tuple of values that define the index. Note that RecipeIndex is a simple index that has only one entry. Extending it to cover more object types is not yet part of the code.

Both indices use the method <code>Index.generate()</code> to do their work. This method combines the information from our domain, sorts it, and returns it in a list structure that will be accepted by Sphinx. This might look complicated but all it really is is a list of tuples like ('tomato', 'TomatoSoup', 'test', 'rec-TomatoSoup',...). Refer to the <code>domain API guide</code> for more information on this API.

These index pages can be referenced with the *ref* role by combining the domain name and the index name value. For example, RecipeIndex can be referenced with :ref:`recipe-recipe` and IngredientIndex can be referenced with :ref:`recipe-ingredient`.

The domain

A Sphinx domain is a specialized container that ties together roles, directives, and indices, among other things. Let's look at the domain we're creating here.

```
class RecipeDomain(Domain):
       name = 'recipe'
3
       label = 'Recipe Sample'
       roles = {
            'ref': XRefRole(),
       directives = {
            'recipe': RecipeDirective,
       indices = {
11
12
            RecipeIndex,
            IngredientIndex,
13
14
       initial_data = {
15
            'recipes': [], # object list
16
            'recipe_ingredients': {}, # name -> object
17
       }
18
```

(continues on next page)

```
19
       def get_full_qualified_name(self, node):
           return f'recipe.{node.arguments[0]}'
21
       def get_objects(self):
23
           yield from self.data['recipes']
25
       def resolve_xref(self, env, fromdocname, builder, typ, target, node,
26
                         contnode):
           match = [(docname, anchor)
28
                     for name, sig, typ, docname, anchor, prio
29
                     in self.get_objects() if sig == target]
           if len(match) > 0:
32
                todocname = match[0][0]
                targ = match[0][1]
34
                return make_refnode(builder, fromdocname, todocname, targ,
36
                                     contnode, targ)
           else:
38
                print('Awww, found nothing')
                return None
40
       def add_recipe(self, signature, ingredients):
42
            """Add a new recipe to the domain."""
43
           name = f'recipe.{signature}'
           anchor = f'recipe-{signature}'
45
            self.data['recipe_ingredients'][name] = ingredients
47
            # name, dispname, type, docname, anchor, priority
48
           self.data['recipes'].append(
49
                (name, signature, 'Recipe', self.env.docname, anchor, 0))
```

There are some interesting things to note about this recipe domain and domains in general. Firstly, we actually register our directives, roles and indices here, via the directives, roles and indices attributes, rather than via calls later on in setup. We can also note that we aren't actually defining a custom role and are instead reusing the sphinx. roles.XRefRole role and defining the sphinx.domains.Domain.resolve_xref method. This method takes two arguments, typ and target, which refer to the cross-reference type and its target name. We'll use target to resolve our destination from our domain's recipes because we currently have only one type of node.

Moving on, we can see that we've defined initial_data. The values defined in initial_data will be copied to env. domaindata[domain_name] as the initial data of the domain, and domain instances can access it via self.data. We see that we have defined two items in initial_data: recipes and recipe_ingredients. Each contains a list of all objects defined (i.e. all recipes) and a hash that maps a canonical ingredient name to the list of objects. The way we name objects is common across our extension and is defined in the get_full_qualified_name method. For each object created, the canonical name is recipe.<recipename>, where <recipename> is the name the documentation writer gives the object (a recipe). This enables the extension to use different object types that share the same name. Having a canonical name and central place for our objects is a huge advantage. Both our indices and our cross-referencing code use this feature.

The setup function

As always, the setup function is a requirement and is used to hook the various parts of our extension into Sphinx. Let's look at the setup function for this extension.

```
def setup(app):
    app.add_domain(RecipeDomain)

return {
    'version': '0.1',
    'parallel_read_safe': True,
    'parallel_write_safe': True,
}
```

This looks a little different to what we're used to seeing. There are no calls to add_directive() or even add_role(). Instead, we have a single call to add_domain() followed by some initialization of the standard domain. This is because we had already registered our directives, roles and indexes as part of the directive itself.

Using the extension

You can now use the extension throughout your project. For example:

Listing 4: index.rst

5.2. Extension tutorials 267

Listing 5: tomato-soup.rst

```
The recipe contains `tomato` and `cilantro`.

.. recipe:recipe:: TomatoSoup
    :contains: tomato, cilantro, salt, pepper

This recipe is a tasty tomato soup, combine all ingredients and cook.
```

The important things to note are the use of the :recipe:ref: role to cross-reference the recipe actually defined elsewhere (using the :recipe:recipe: directive).

For more information, refer to the docutils⁴⁰⁰ documentation and *Sphinx Extensions API*.

Developing autodoc extension for IntEnum

The objective of this tutorial is to create an extension that adds support for new type for autodoc. This autodoc extension will format the IntEnum class from Python standard library. (module enum)

Overview

We want the extension that will create auto-documentation for IntEnum. IntEnum is the integer enum class from standard library enum module.

Currently this class has no special auto documentation behavior.

We want to add following to autodoc:

- A new autointenum directive that will document the IntEnum class.
- The generated documentation will have all the enum possible values with names.
- The autointenum directive will have an option :hex: which will cause the integers be printed in hexadecimal form.

Prerequisites

We need the same setup as in *the previous extensions*. This time, we will be putting out extension in a file called autodoc_intenum.py. The my_enums.py will contain the sample enums we will document.

Here is an example of the folder structure you might obtain:

```
source
—___ext
—__autodoc_intenum.py
—__conf.py
—__index.rst
___my_enums.py
```

⁴⁰⁰ https://docutils.sourceforge.io/docs/

Writing the extension

Start with setup function for the extension.

```
def setup(app: Sphinx) -> None:
    app.setup_extension('sphinx.ext.autodoc') # Require autodoc extension
    app.add_autodocumenter(IntEnumDocumenter)
```

The *setup_extension()* method will pull the autodoc extension because our new extension depends on autodoc. *add_autodocumenter()* is the method that registers our new auto documenter class.

We want to import certain objects from the autodoc extension:

```
from __future__ import annotations

from enum import IntEnum
from typing import TYPE_CHECKING, Any

from sphinx.ext.autodoc import ClassDocumenter, bool_option
```

There are several different documenter classes such as MethodDocumenter or AttributeDocumenter available in the autodoc extension but our new class is the subclass of ClassDocumenter which a documenter class used by autodoc to document classes.

This is the definition of our new the auto-documenter class:

```
class IntEnumDocumenter(ClassDocumenter):
       objtype = 'intenum'
       directivetype = ClassDocumenter.objtype
       priority = 10 + ClassDocumenter.priority
       option_spec = dict(ClassDocumenter.option_spec)
       option_spec['hex'] = bool_option
       @classmethod
       def can_document_member(cls,
                                member: Any, membername: str,
10
                                isattr: bool, parent: Any) -> bool:
           try:
12
               return issubclass(member, IntEnum)
           except TypeError:
14
               return False
16
       def add_directive_header(self, sig: str) -> None:
           super().add_directive_header(sig)
           self.add_line('
                              :final:', self.get_sourcename())
19
20
       def add_content(self,
21
                        more_content: StringList | None,
22
                        no_docstring: bool = False,
23
                        ) -> None:
24
25
           super().add_content(more_content, no_docstring)
27
           source_name = self.get_sourcename()
```

(continues on next page)

```
enum_object: IntEnum = self.object
29
           use_hex = self.options.hex
           self.add_line('', source_name)
31
           for the_member_name, enum_member in enum_object.__members__.items():
33
               the_member_value = enum_member.value
               if use hex:
35
                    the_member_value = hex(the_member_value)
36
               self.add_line(
38
                    f"**{the_member_name}**: {the_member_value}", source_name)
               self.add_line('', source_name)
```

Important attributes of the new class:

obitype

This attribute determines the auto directive name. In this case the auto directive will be autointenum.

directivetype

This attribute sets the generated directive name. In this example the generated directive will be ..:py:class::.

priority

the larger the number the higher is the priority. We want our documenter be higher priority than the parent.

option_spec

option specifications. We copy the parent class options and add a new option hex.

Overridden members:

can document member

This member is important to override. It should return *True* when the passed object can be documented by this class.

add directive header

This method generates the directive header. We add **:final:** directive option. Remember to call **super** or no directive will be generated.

add_content

This method generates the body of the class documentation. After calling the super method we generate lines for enum description.

Using the extension

You can now use the new autodoc directive to document any IntEnum.

For example, you have the following IntEnum:

Listing 6: my_enums.py

```
class Colors(IntEnum):
    """Colors enumerator"""
    NONE = 0
    RED = 1
    GREEN = 2
    BLUE = 3
```

This will be the documentation file with auto-documentation directive:

Listing 7: index.rst

```
.. autointenum:: my_enums.Colors
```

5.3 Configuring builders

Discover builders by entry point

New in version 1.6.

builder extensions can be discovered by means of entry points⁴⁰¹ so that they do not have to be listed in the *extensions* configuration value.

Builder extensions should define an entry point in the "sphinx.builders" group. The name of the entry point needs to match your builder's *name* attribute, which is the name passed to the *sphinx-build -b* option. The entry point value should equal the dotted name of the extension module. Here is an example of how an entry point for 'mybuilder' can be defined in the extension's pyproject.toml

```
[project.entry-points."sphinx.builders"]
mybuilder = "my.extension.module"
```

Note that it is still necessary to register the builder using add_builder() in the extension's setup() function.

5.4 Templating

Sphinx uses the Jinja⁴⁰² templating engine for its HTML templates. Jinja is a text-based engine, inspired by Django templates, so anyone having used Django will already be familiar with it. It also has excellent documentation for those who need to make themselves familiar with it.

Do I need to use Sphinx's templates to produce HTML?

No. You have several other options:

- You can write a *TemplateBridge* subclass that calls your template engine of choice, and set the *template_bridge* configuration value accordingly.
- You can write a custom builder that derives from StandaloneHTMLBuilder and calls your template engine of choice.
- You can use the *PickleHTMLBuilder* that produces pickle files with the page contents, and postprocess them using a custom tool, or use them in your Web application.

 $^{^{401}\} https://setuptools.readthedocs.io/en/latest/setuptools.html \# dynamic-discovery-of-services- and-plugins$

⁴⁰² https://jinja.palletsprojects.com/

Jinja/Sphinx Templating Primer

The default templating language in Sphinx is Jinja. It's Django/Smarty inspired and easy to understand. The most important concept in Jinja is *template inheritance*, which means that you can overwrite only specific blocks within a template, customizing it while also keeping the changes at a minimum.

To customize the output of your documentation you can override all the templates (both the layout templates and the child templates) by adding files with the same name as the original filename into the template directory of the structure the Sphinx quickstart generated for you.

Sphinx will look for templates in the folders of *templates_path* first, and if it can't find the template it's looking for there, it falls back to the selected theme's templates.

A template contains **variables**, which are replaced with values when the template is evaluated, **tags**, which control the logic of the template and **blocks** which are used for template inheritance.

Sphinx's *basic* theme provides base templates with a couple of blocks it will fill with data. These are located in the themes/basic subdirectory of the Sphinx installation directory, and used by all builtin Sphinx themes. Templates with the same name in the *templates_path* override templates supplied by the selected theme.

For example, to add a new link to the template area containing related links all you have to do is to add a new template called layout.html with the following contents:

By prefixing the name of the overridden template with an exclamation mark, Sphinx will load the layout template from the underlying HTML theme.

Important: If you override a block, call {{ super() }} somewhere to render the block's original content in the extended template – unless you don't want that content to show up.

Working with the builtin templates

The builtin **basic** theme supplies the templates that all builtin Sphinx themes are based on. It has the following elements you can override or use:

Blocks

The following blocks exist in the layout.html template:

doctype

The doctype of the output format. By default this is XHTML 1.0 Transitional as this is the closest to what Sphinx and Docutils generate and it's a good idea not to change it unless you want to switch to HTML 5 or a different but compatible XHTML doctype.

linktags

This block adds a couple of tags to the head section of the template.

extrahead

This block is empty by default and can be used to add extra contents into the <head> tag of the generated HTML file. This is the right place to add references to JavaScript or extra CSS files.

relbar1, relbar2

This block contains the *relation bar*, the list of related links (the parent documents on the left, and the links to index, modules etc. on the right). relbar1 appears before the document, relbar2 after the document. By default, both blocks are filled; to show the relbar only before the document, you would override *relbar2* like this:

```
{% block relbar2 %}{% endblock %}
```

rootrellink, relbaritems

Inside the relbar there are three sections: The rootrellink, the links from the documentation and the custom relbaritems. The rootrellink is a block that by default contains a list item pointing to the root document by default, the relbaritems is an empty block. If you override them to add extra links into the bar make sure that they are list items and end with the reldelim1.

document

The contents of the document itself. It contains the block "body" where the individual content is put by subtemplates like page.html.

Note: In order for the built-in JavaScript search to show a page preview on the results page, the document or body content should be wrapped in an HTML element containing the role="main" attribute. For example:

```
<div role="main">
  {% block document %}{% endblock %}
</div>
```

sidebar1, sidebar2

A possible location for a sidebar. sidebar1 appears before the document and is empty by default, sidebar2 after the document and contains the default sidebar. If you want to swap the sidebar location override this and call the sidebar helper:

```
{% block sidebar1 %}{{ sidebar() }}{% endblock %}
{% block sidebar2 %}{% endblock %}
```

(The sidebar2 location for the sidebar is needed by the sphinxdoc.css stylesheet, for example.)

sidebarlogo

The logo location within the sidebar. Override this if you want to place some content at the top of the sidebar.

footer

The block for the footer div. If you want a custom footer or markup before or after it, override this one.

The following four blocks are *only* used for pages that do not have assigned a list of custom sidebars in the *html_sidebars* config value. Their use is deprecated in favor of separate sidebar templates, which can be included via *html_sidebars*.

sidebartoc

The table of contents within the sidebar.

Deprecated since version 1.0.

sidebarrel

The relation links (previous, next document) within the sidebar.

Deprecated since version 1.0.

sidebarsourcelink

The "Show source" link within the sidebar (normally only shown if this is enabled by html_show_sourcelink).

Deprecated since version 1.0.

5.4. Templating 273

sidebarsearch

The search box within the sidebar. Override this if you want to place some content at the bottom of the sidebar.

Deprecated since version 1.0.

Configuration Variables

Inside templates you can set a couple of variables used by the layout template using the {% set %} tag:

reldelim1

The delimiter for the items on the left side of the related bar. This defaults to ' »' Each item in the related bar ends with the value of this variable.

reldelim2

The delimiter for the items on the right side of the related bar. This defaults to ' | '. Each item except of the last one in the related bar ends with the value of this variable.

Overriding works like this:

```
{% extends "!layout.html" %}
{% set reldelim1 = ' >' %}
```

script_files

Add additional script files here, like this:

```
{% set script_files = script_files + ["_static/myscript.js"] %}
```

Deprecated since version 1.8.0: Please use .Sphinx.add_js_file() instead.

Helper Functions

Sphinx provides various Jinja functions as helpers in the template. You can use them to generate links or output multiply used elements.

pathto(document)

Return the path to a Sphinx document as a URL. Use this to refer to built documents.

pathto(file, 1)

Return the path to a *file* which is a filename relative to the root of the generated output. Use this to refer to static files

hasdoc(document)

Check if a document with the name document exists.

sidebar()

Return the rendered sidebar.

relbar()

Return the rendered relation bar.

warning(message)

Emit a warning message.

Global Variables

These global variables are available in every template and are safe to use. There are more, but most of them are an implementation detail and might change in the future.

builder

The name of the builder (e.g. html or htmlhelp).

copyright

The value of copyright.

docstitle

The title of the documentation (the value of html_title), except when the "single-file" builder is used, when it is set to None.

embedded

True if the built HTML is meant to be embedded in some viewing application that handles navigation, not the web browser, such as for HTML help or Qt help formats. In this case, the sidebar is not included.

favicon_url

The relative path to the HTML favicon image from the current document, or URL to the favicon, or ''.

New in version 4.0.

file_suffix

The value of the builder's *out_suffix* attribute, i.e. the file name extension that the output files will get. For a standard HTML builder, this is usually .html.

has_source

True if the reST document sources are copied (if httml_copy_source is True).

language

The value of language.

last_updated

The build date.

logo_url

The relative path to the HTML logo image from the current document, or URL to the logo, or ''.

New in version 4.0.

master_doc

Same as root_doc.

Changed in version 4.0: Renamed to root_doc.

root_doc

The value of *root_doc*, for usage with *pathto()*.

Changed in version 4.0: Renamed from master_doc.

pagename

The "page name" of the current file, i.e. either the document name if the file is generated from a reST source, or the equivalent hierarchical name relative to the output directory ([directory/]filename_without_extension).

project

The value of *project*.

5.4. Templating 275

release

The value of release.

rellinks

A list of links to put at the left side of the relbar, next to "next" and "prev". This usually contains links to the general index and other indices, such as the Python module index. If you add something yourself, it must be a tuple (pagename, link title, accesskey, link text).

shorttitle

The value of html_short_title.

show_source

True if html_show_sourcelink is True.

sphinx_version

The version of Sphinx used to build represented as a string for example "3.5.1".

sphinx_version_tuple

The version of Sphinx used to build represented as a tuple of five elements. For Sphinx version 3.5.1 beta 3 this would be (3, 5, 1, 'beta', 3). The fourth element can be one of: alpha, beta, rc, final. final always has 0 as the last element.

New in version 4.2.

docutils_version_info

The version of Docutils used to build represented as a tuple of five elements. For Docutils version 0.16.1 beta 2 this would be (0, 16, 1, 'beta', 2). The fourth element can be one of: alpha, beta, candidate, final. final always has 0 as the last element.

New in version 5.0.2.

styles

A list of the names of the main stylesheets as given by the theme or html_style.

New in version 5.1.

title

The title of the current document, as used in the <title> tag.

use_opensearch

The value of html_use_opensearch.

version

The value of *version*.

In addition to these values, there are also all **theme options** available (prefixed by theme_), as well as the values given by the user in https://doi.org/10.2016/journal.com.

In documents that are created from source files (as opposed to automatically-generated files like the module index, or documents that already are in HTML form), these variables are also available:

body

A string containing the content of the page in HTML form as produced by the HTML builder, before the theme is applied.

display_toc

A boolean that is True if the toc contains more than one entry.

meta

Document metadata (a dictionary), see File-wide metadata.

metatags

A string containing the page's HTML meta⁴⁰³ tags.

next

The next document for the navigation. This variable is either false or has two attributes *link* and *title*. The title contains HTML markup. For example, to generate a link to the next page, you can use this snippet:

```
{% if next %}
<a href="{{ next.link|e }}">{{ next.title }}</a>
{% endif %}
```

page_source_suffix

The suffix of the file that was rendered. Since we support a list of *source_suffix*, this will allow you to properly link to the original source file.

parents

A list of parent documents for navigation, structured like the *next* item.

prev

Like *next*, but for the previous page.

sourcename

The name of the copied source file for the current document. This is only nonempty if the *html_copy_source* value is True. This has empty value on creating automatically-generated files.

toc

The local table of contents for the current page, rendered as HTML bullet lists.

toctree

A callable yielding the global TOC tree containing the current page, rendered as HTML bullet lists. Optional keyword arguments:

collapse

If true, all TOC entries that are not ancestors of the current page are collapsed. True by default.

maxdepth

The maximum depth of the tree. Set it to -1 to allow unlimited depth. Defaults to the max depth selected in the toctree directive.

titles_only

If true, put only top-level document titles in the tree. False by default.

includehidden

If true, the ToC tree will also contain hidden entries. False by default.

5.4. Templating 277

⁴⁰³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#meta

5.5 HTML theme development

New in version 0.6.

Note: This document provides information about creating your own theme. If you simply wish to use a pre-existing HTML themes, refer to *HTML Theming*.

Sphinx supports changing the appearance of its HTML output via *themes*. A theme is a collection of HTML templates, stylesheet(s) and other static files. Additionally, it has a configuration file which specifies from which theme to inherit, which highlighting style to use, and what options exist for customizing the theme's look and feel.

Themes are meant to be project-unaware, so they can be used for different projects without change.

Note: See *Sphinx Extensions API* for more information that may be helpful in developing themes.

Creating themes

Themes take the form of either a directory or a zipfile (whose name is the theme name), containing the following:

- A theme.conf file.
- HTML templates, if needed.
- A static/ directory containing any static files that will be copied to the output static directory on build. These can be images, styles, script files.

The theme.conf file is in INI format 1 (readable by the standard Python configparser 404 module) and has the following structure:

```
[theme]
inherit = base theme
stylesheet = main CSS name
pygments_style = stylename
sidebars = localtoc.html, relations.html, sourcelink.html, searchbox.html

[options]
variable = default value
```

- The **inherit** setting gives the name of a "base theme", or **none**. The base theme will be used to locate missing templates (most themes will not have to supply most templates if they use basic as the base theme), its options will be inherited, and all of its static files will be used as well. If you want to also inherit the stylesheet, include it via CSS' @import in your own.
- The **stylesheet** setting gives a list of CSS filenames separated commas which will be referenced in the HTML header. You can also use CSS' @import technique to include one from the other, or use a custom HTML template that adds <link rel="stylesheet"> tags as necessary. Setting the html_style config value will override this setting.
- The **pygments_style** setting gives the name of a Pygments style to use for highlighting. This can be overridden by the user in the *pygments_style* config value.

¹ It is not an executable Python file, as opposed to conf.py, because that would pose an unnecessary security risk if themes are shared.

 $^{^{404}\} https://docs.python.org/3/library/configparser.html\#module-configparser$

- The **pygments_dark_style** setting gives the name of a Pygments style to use for highlighting when the CSS media query (prefers-color-scheme: dark) evaluates to true. It is injected into the page using add_css_file().
- The **sidebars** setting gives the comma separated list of sidebar templates for constructing sidebars. This can be overridden by the user in the *html_sidebars* config value.
- The **options** section contains pairs of variable names and default values. These options can be overridden by the user in httml_theme_options and are accessible from all templates as theme_<name>.

New in version 1.7: sidebar settings

Changed in version 5.1: The stylesheet setting accepts multiple CSS filenames

Distribute your theme as a Python package

As a way to distribute your theme, you can use a Python package. This makes it easier for users to set up your theme.

To distribute your theme as a Python package, please define an entry point called sphinx.html_themes in your pyproject.toml file, and write a setup() function to register your theme using the add_html_theme() API:

```
# pyproject.toml

[project.entry-points."sphinx.html_themes"]
name_of_theme = "your_theme_package"
```

```
# your_theme_package.py
from os import path

def setup(app):
    app.add_html_theme('name_of_theme', path.abspath(path.dirname(__file__)))
```

If your theme package contains two or more themes, please call add_html_theme() twice or more.

New in version 1.2: 'sphinx_themes' entry_points feature.

Deprecated since version 1.6: sphinx_themes entry_points has been deprecated.

New in version 1.6: sphinx.html_themes entry_points feature.

Templating

The *guide to templating* is helpful if you want to write your own templates. What is important to keep in mind is the order in which Sphinx searches for templates:

- First, in the user's templates_path directories.
- Then, in the selected theme.
- Then, in its base theme, its base's base theme, etc.

When extending a template in the base theme with the same name, use the theme name as an explicit directory: {% extends "basic/layout.html" %}. From a user templates_path template, you can still use the "exclamation mark" syntax as described in the templating document.

Static templates

Since theme options are meant for the user to configure a theme more easily, without having to write a custom stylesheet, it is necessary to be able to template static files as well as HTML files. Therefore, Sphinx supports so-called "static templates", like this:

If the name of a file in the static/ directory of a theme (or in the user's static path, for that matter) ends with _t, it will be processed by the template engine. The _t will be left from the final file name. For example, the *classic* theme has a file static/classic.css_t which uses templating to put the color options into the stylesheet. When a documentation project is built with the classic theme, the output directory will contain a _static/classic.css file where all template tags have been processed.

Use custom page metadata in HTML templates

Any key / value pairs in *field lists* that are placed *before* the page's title will be available to the Jinja template when building the page within the *meta* attribute. For example, if a page had the following text before its first title:

```
imykey: My value

My first title
------
```

Then it could be accessed within a Jinja template like so:

```
{%- if meta is mapping %}
    {{ meta.get("mykey") }}
{%- endif %}
```

Note the check that meta is a dictionary ("mapping" in Jinja terminology) to ensure that using it in this way is valid.

Defining custom template functions

Sometimes it is useful to define your own function in Python that you wish to then use in a template. For example, if you'd like to insert a template value with logic that depends on the user's configuration in the project, or if you'd like to include non-trivial checks and provide friendly error messages for incorrect configuration in the template.

To define your own template function, you'll need to define two functions inside your module:

- A page context event handler (or registration) function. This is connected to the *Sphinx* application via an event callback.
- A **template function** that you will use in your Jinja template.

First, define the registration function, which accepts the arguments for html-page-context.

Within the registration function, define the template function that you'd like to use within Jinja. The template function should return a string or Python objects (lists, dictionaries) with strings inside that Jinja uses in the templating process

Note: The template function will have access to all of the variables that are passed to the registration function.

At the end of the registration function, add the template function to the Sphinx application's context with context['template_func'] = template_func.

Finally, in your extension's setup() function, add your registration function as a callback for html-page-context.

```
# The registration function
def setup_my_func(app, pagename, templatename, context, doctree):
    # The template function
    def my_func(mystring):
        return "Your string is %s" % mystring
    # Add it to the page's context
    context['my_func'] = my_func

# Your extension's setup function
def setup(app):
    app.connect("html-page-context", setup_my_func)
```

Now, you will have access to this function in jinja like so:

```
<div>
{{ my_func("some string") }}
</div>
```

Add your own static files to the build assets

By default, Sphinx copies static files on the static/ directory of the template directory. However, if your package needs to place static files outside of the static/ directory for some reasons, you need to copy them to the _static/ directory of HTML outputs manually at the build via an event hook. Here is an example of code to accomplish this:

```
from os import path
from sphinx.util.fileutil import copy_asset_file

def copy_custom_files(app, exc):
    if app.builder.format == 'html' and not exc:
        staticdir = path.join(app.builder.outdir, '_static')
        copy_asset_file('path/to/myextension/_static/myjsfile.js', staticdir)

def setup(app):
    app.connect('build-finished', copy_custom_files)
```

Inject JavaScript based on user configuration

If your extension makes use of JavaScript, it can be useful to allow users to control its behavior using their Sphinx configuration. However, this can be difficult to do if your JavaScript comes in the form of a static library (which will not be built with Jinja).

There are two ways to inject variables into the JavaScript space based on user configuration.

First, you may append _t to the end of any static files included with your extension. This will cause Sphinx to process these files with the templating engine, allowing you to embed variables and control behavior.

For example, the following JavaScript structure:

```
mymodule/
    ____static
    ____ myjsfile.js_t
    ___ mymodule.py
```

Will result in the following static file placed in your HTML's build output:

```
_build/
_____html
______static
_____ myjsfile.js
```

See Static templates for more information.

Second, you may use the *Sphinx.add_js_file()* method without pointing it to a file. Normally, this method is used to insert a new JavaScript file into your site. However, if you do *not* pass a file path, but instead pass a string to the "body" argument, then this text will be inserted as JavaScript into your site's head. This allows you to insert variables into your project's JavaScript from Python.

For example, the following code will read in a user-configured value and then insert this value as a JavaScript variable, which your extension's JavaScript code may use:

```
# This function reads in a variable and inserts it into JavaScript
def add_js_variable(app):
    # This is a configuration that you've specified for users in `conf.py`
    js_variable = app.config['my_javascript_variable']
    js_text = "var my_variable = '%s';" % js_variable
    app.add_js_file(None, body=js_text)
# We connect this function to the step after the builder is initialized
def setup(app):
    # Tell Sphinx about this configuration variable
    app.add_config_value('my_javascript_variable', 0, 'html')
    # Run the function after the builder is initialized
    app.connect('builder-inited', add_js_variable)
```

As a result, in your theme you can use code that depends on the presence of this variable. Users can control the variable's value by defining it in their conf.py file.

CHAPTER

SIX

LATEX CUSTOMIZATION

Unlike *the HTML builders*, the latex builder does not benefit from prepared themes. The *Options for LaTeX output*, and particularly the *latex elements* variable, provides much of the interface for customization. For example:

```
# inside conf.py
latex_engine = 'xelatex'
latex_elements = {
    'fontpkg': r'''
\setmainfont{DejaVu Serif}
\setsansfont{DejaVu Sans}
\setmonofont{DejaVu Sans Mono}
    'preamble': r'''
\usepackage[titles]{tocloft}
\cftsetpnumwidth {1.25cm}\cftsetrmarg{1.5cm}
\setlength{\cftchapnumwidth}{0.75cm}
\setlength{\cftsecindent}{\cftchapnumwidth}
\setlength{\cftsecnumwidth}{1.25cm}
    'fncychap': r'\usepackage[Bjornstrup]{fncychap}'.
    'printindex': r'\footnotesize\raggedright\printindex',
latex_show_urls = 'footnote'
```

Note: Keep in mind that backslashes must be doubled in Python string literals to avoid interpretation as escape sequences. Alternatively, you may use raw strings as is done above.

6.1 The latex_elements configuration setting

A dictionary that contains LaTeX snippets overriding those Sphinx usually puts into the generated .tex files. Its 'sphinxsetup' key is described *separately*. It allows also local configurations inserted in generated files, via raw⁴⁰⁵ directives. For example, in the PDF documentation this chapter is styled especially, as will be described later.

Keys that you may want to override include:

'papersize'

Paper size option of the document class ('a4paper' or 'letterpaper')

⁴⁰⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#raw

```
Default: 'letterpaper'
```

'pointsize'

Point size option of the document class ('10pt', '11pt' or '12pt')

Default: '10pt'

'pxunit'

The value of the px when used in image attributes width and height. The default value is '0.75bp' which achieves 96px=1in (in TeX 1in = 72bp = 72.27pt.) To obtain for example 100px=1in use '0.01in' or '0.7227pt' (the latter leads to TeX computing a more precise value, due to the smaller unit used in the specification); for 72px=1in, simply use '1bp'; for 90px=1in, use '0.8bp' or '0.803pt'.

Default: '0.75bp'

New in version 1.5.

'passoptionstopackages'

A string which will be positioned early in the preamble, designed to contain \\PassOptionsToPackage{options}{foo} commands.

Hint: It may be also used for loading LaTeX packages very early in the preamble. For example package fancybox is incompatible with being loaded via the 'preamble' key, it must be loaded earlier.

Default: ''

New in version 1.4.

'babel'

"babel" package inclusion, default '\usepackage{babel}' (the suitable document language string is passed as class option, and english is used if no language.) For Japanese documents, the default is the empty string.

With XeLaTeX and LuaLaTeX, Sphinx configures the LaTeX document to use polyglossia⁴⁰⁶, but one should be aware that current babel⁴⁰⁷ has improved its support for Unicode engines in recent years and for some languages it may make sense to prefer babel over polyglossia.

Hint: After modifying a core LaTeX key like this one, clean up the LaTeX build repertory before next PDF build, else left-over auxiliary files are likely to break the build.

Default: '\\usepackage{babel}' ('' for Japanese documents)

Changed in version 1.5: For *latex_engine* set to 'xelatex', the default is '\\usepackage{polyglossia}\\n\\setmainlanguage{<language>}'.

Changed in version 1.6: 'lualatex' uses same default setting as 'xelatex'

Changed in version 1.7.6: For French, xelatex and lualatex default to using babel, not polyglossia.

'fontpkg'

Font package inclusion. The default is:

```
r"""\usepackage{tgtermes}
\usepackage{tgheros}
\renewcommand\ttdefault{txtt}
"""
```

⁴⁰⁶ https://ctan.org/pkg/polyglossia

⁴⁰⁷ https://ctan.org/pkg/babel

For 'xelatex' and 'lualatex' however the default is to use the GNU FreeFont.

Changed in version 1.2: Defaults to '' when the *language* uses the Cyrillic script.

Changed in version 2.0: Incorporates some font substitution commands to help support occasional Greek or Cyrillic in a document using 'pdflatex' engine.

Changed in version 4.0.0:

- The font substitution commands added at 2.0 have been moved to the 'fontsubstitution' key, as their presence here made it complicated for user to customize the value of 'fontpkg'.
- The default font setting has changed: it still uses Times and Helvetica clones for serif and sans serif, but via better, more complete TeX fonts and associated LaTeX packages. The monospace font has been changed to better match the Times clone.

'fncychap'

Inclusion of the "fncychap" package (which makes fancy chapter titles), default '\\usepackage[Bjarne]{fncychap}' for English documentation (this option is slightly customized by Sphinx), '\usepackage[Sonny]{fncychap}' for internationalized docs (because the "Bjarne" style uses numbers spelled out in English). Other "fncychap" styles you can try are "Lenny", "Glenn", "Conny", "Rejne" and "Bjornstrup". You can also set this to '' to disable fncychap.

Default: '\usepackage[Bjarne]{fncychap}' for English documents, '\\ usepackage[Sonny]{fncychap}' for internationalized documents, and '' for Japanese documents.

'preamble'

Additional preamble content. One may move all needed macros into some file mystyle.tex.txt of the project source repertory, and get LaTeX to import it at run time:

```
'preamble': r'\input{mystyle.tex.txt}',
# or, if the \ProvidesPackage LaTeX macro is used in a file mystyle.sty
'preamble': r'\usepackage{mystyle}',
```

It is then needed to set appropriately latex_additional_files, for example:

```
latex_additional_files = ["mystyle.sty"]
```

Do not use .tex as suffix, else the file is submitted itself to the PDF build process, use .tex.txt or .sty as in the examples above.

Default: ''

'figure_align'

Latex figure float alignment. Whenever an image doesn't fit into the current page, it will be 'floated' into the next page but may be preceded by any other text. If you don't like this behavior, use 'H' which will disable floating and position figures strictly in the order they appear in the source.

Default: 'htbp' (here, top, bottom, page)

New in version 1.3.

'atendofbody'

Additional document content (right before the indices).

Default: ''

New in version 1.5.

'extrapackages'

Additional LaTeX packages. For example:

```
latex_elements = {
    'extrapackages': r'\usepackage{isodate}'
}
```

The specified LaTeX packages will be loaded before hyperref package and packages loaded from Sphinx extensions.

Hint: If you'd like to load additional LaTeX packages after hyperref, use 'preamble' key instead.

Default: ''

New in version 2.3.

'footer'

Additional footer content (before the indices).

Default: ''

Deprecated since version 1.5: Use 'atendofbody' key instead.

Keys that don't need to be overridden unless in special cases are:

'extraclassoptions'

The default is the empty string. Example: 'extraclassoptions': 'openany' will allow chapters (for documents of the 'manual' type) to start on any page.

Default: ''

New in version 1.2.

Changed in version 1.6: Added this documentation.

'maxlistdepth'

LaTeX allows by default at most 6 levels for nesting list and quote-like environments, with at most 4 enumerated lists, and 4 bullet lists. Setting this key for example to '10' (as a string) will allow up to 10 nested levels (of all sorts). Leaving it to the empty string means to obey the LaTeX default.

Warning:

- Using this key may prove incompatible with some LaTeX packages or special document classes which do their own list customization.
- The key setting is silently *ignored* if \usepackage{enumitem} is executed inside the document preamble. Use then rather the dedicated commands of this LaTeX package.

Default: 6

New in version 1.5.

'inputenc'

"inputenc" package inclusion.

Default: '\\usepackage[utf8]{inputenc}' when using pdflatex, else ''.

Note: If using utf8x in place of utf8 it is mandatory to extend the LaTeX preamble with suitable \PreloadUnicodePage{<number>} commands, as per the utf8x documentation (texdoc ucs on a TeXLive based TeX installation). Else, unexpected and possibly hard-to-spot problems (i.e. not causing a build crash) may arise in the PDF, in particular regarding hyperlinks.

Even if these precautions are taken, PDF build via pdflatex engine may crash due to upstream LaTeX not being fully compatible with utf8x. For example, in certain circumstances related to code-blocks, or attempting to include images whose filenames contain Unicode characters. Indeed, starting in 2015, upstream LaTeX with pdflatex engine has somewhat enhanced native support for Unicode and is becoming more and more incompatible with utf8x. In particular, since the October 2019 LaTeX release, filenames can use Unicode characters, and even spaces. At Sphinx level this means e.g. that the image⁴⁰⁸ and figure⁴⁰⁹ directives are now compatible with such filenames for PDF via LaTeX output. But this is broken if utf8x is in use.

Changed in version 1.4.3: Previously '\usepackage[utf8]{inputenc}' was used for all compilers.

'cmappkg'

"cmap" package inclusion.

Default: '\\usepackage{cmap}'

New in version 1.2.

'fontenc'

Customize this from its default '\\usepackage[T1]{fontenc}' to:

- '\usepackage[X2,T1]{fontenc}' if you need occasional Cyrillic letters (физика частиц),
- '\usepackage [LGR, T1] {fontenc}' if you need occasional Greek letters (Σωματιδιαχή φυσιχή).

Use [LGR, X2, T1] rather if both are needed.

Attention:

- Do not use this key for a *latex_engine* other than 'pdflatex'.
- If Greek is main language, do not use this key. Since Sphinx 2.2.1, xelatex will be used automatically as latex_engine.
- The TeX installation may need some extra packages. For example, on Ubuntu xenial, packages texlive-lang-greek and cm-super are needed for LGR to work. And texlive-lang-cyrillic and cm-super are needed for support of Cyrillic.

Changed in version 1.5: Defaults to '\\usepackage{fontspec}' when latex_engine is 'xelatex'.

Changed in version 1.6: 'lualatex' uses fontspec per default like 'xelatex'.

Changed in version 2.0: 'lualatex' executes \defaultfontfeatures[\rmfamily,\sffamily]{} to disable TeX ligatures transforming << and >> as escaping working with pdflatex/xelatex failed with lualatex.

Changed in version 2.0: Detection of LGR, T2A, X2 to trigger support of occasional Greek or Cyrillic letters ('pdflatex').

Changed in version 2.3.0: 'xelatex' executes \defaultfontfeatures[\rmfamily,\sffamily]{} in order to avoid contractions of -- into en-dash or transforms of straight quotes into curly ones in PDF (in non-literal text paragraphs) despite *smartquotes* being set to False.

⁴⁰⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#image

⁴⁰⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#figure

'fontsubstitution'

Ignored if 'fontenc' was not configured to use LGR or X2 (or T2A). In case 'fontpkg' key is configured for usage with some TeX fonts known to be available in the LGR or X2 encodings, set this one to be the empty string. Else leave to its default.

Ignored with latex_engine other than 'pdflatex'.

New in version 4.0.0.

'textgreek'

For the support of occasional Greek letters.

It is ignored with 'platex', 'xelatex' or 'lualatex' as *latex_engine* and defaults to either the empty string or to '\usepackage{textalpha}' for 'pdflatex' depending on whether the 'fontenc' key was used with LGR or not. Only expert LaTeX users may want to customize this key.

It can also be used as r'\usepackage{textalpha,alphabeta}' to let 'pdflatex' support Greek Unicode input in math context. For example :math: ` α ` (U+03B1) will render as α .

Default: '\\usepackage{textalpha}' or '' if fontenc does not include the LGR option.

New in version 2.0.

'geometry'

"geometry" package inclusion, the default definition is:

'\\usepackage{geometry}'

with an additional [dvipdfm] for Japanese documents. The Sphinx LaTeX style file executes:

\PassOptionsToPackage{hmargin=1in,vmargin=1in,marginpar=0.5in}{geometry}

which can be customized via corresponding 'sphinxsetup' options.

Default: '\\usepackage{geometry}' (or '\\usepackage[dvipdfm]{geometry}' for Japanese documents)

New in version 1.5.

Changed in version 1.5.2: dvipdfm option if latex_engine is 'platex'.

New in version 1.5.3: The 'sphinxsetup' keys for the margins.

Changed in version 1.5.3: The location in the LaTeX file has been moved to after \usepackage{sphinx} and \sphinxsetup{..}, hence also after insertion of 'fontpkg' key. This is in order to handle the paper layout options in a special way for Japanese documents: the text width will be set to an integer multiple of the zenkaku width, and the text height to an integer multiple of the baseline. See the hmargin documentation for more.

'hyperref'

"hyperref" package inclusion; also loads package "hyperef" and issues \urlstyle{same}. This is done after sphinx.sty file is loaded and before executing the contents of 'preamble' key.

Attention: Loading of packages "hyperref" and "hyperge" is mandatory.

New in version 1.5: Previously this was done from inside sphinx.sty.

'maketitle'

"maketitle" call. Override if you want to generate a differently styled title page.

Hint: If the key value is set to r'\newcommand\sphinxbackoftitlepage{<Extra material>}\ sphinxmaketitle', then <Extra material> will be typeset on back of title page ('manual' docclass only).

Default: '\\sphinxmaketitle'

Changed in version 1.8.3: Original \maketitle from document class is not overwritten, hence is reusable as part of some custom setting for this key.

New in version 1.8.3: \sphinxbackoftitlepage optional macro. It can also be defined inside 'preamble' key rather than this one.

'releasename'

Value that prefixes 'release' element on title page. As for *title* and *author* used in the tuples of <code>latex_documents</code>, it is inserted as LaTeX markup.

Default: 'Release'

'tableofcontents'

"tableofcontents" call. The default of '\\sphinxtableofcontents' is a wrapper of unmodified \tableofcontents, which may itself be customized by user loaded packages. Override if you want to generate a different table of contents or put content between the title page and the TOC.

Default: '\\sphinxtableofcontents'

Changed in version 1.5: Previously the meaning of \tableofcontents itself was modified by Sphinx. This created an incompatibility with dedicated packages modifying it also such as "tocloft" or "etoc".

'transition'

Commands used to display transitions. Override if you want to display transitions differently.

Default: '\n\n\\bigskip\\hrule\\bigskip\n\n'

New in version 1.2.

Changed in version 1.6: Remove unneeded {} after \\hrule.

'makeindex'

"makeindex" call, the last thing before \begin{document}. With '\\ usepackage[columns=1]{idxlayout}\\makeindex' the index will use only one column. You may have to install idxlayout LaTeX package.

Default: '\\makeindex'

'printindex'

"printindex" call, the last thing in the file. Override if you want to generate the index differently, append some content after the index, or change the font. As LaTeX uses two-column mode for the index it is often advisable to set this key to '\footnotesize\\raggedright\\printindex'. Or, to obtain a one-column index, use '\\def\\twocolumn[#1]{#1}\\printindex' (this trick may fail if using a custom document class; then try the idxlayout approach described in the documentation of the 'makeindex' key).

Default: '\\printindex'

'fvset'

Customization of fancyvrb LaTeX package.

The default value is '\\fvset{fontsize=auto}' which means that the font size will adjust correctly if a codeblock ends up in a footnote. You may need to modify this if you use custom fonts: '\\fvset{fontsize=\\ small}' if the monospace font is Courier-like.

Default: '\\fvset{fontsize=auto}'

New in version 1.8.

Changed in version 2.0: For 'xelatex' and 'lualatex' defaults to '\\fvset{fontsize=\\small}' as this is adapted to the relative widths of the FreeFont family.

Changed in version 4.0.0: Changed default for 'pdflatex'. Previously it was using ' $\footnote{fontsize=}\$ small}'.

Changed in version 4.1.0: Changed default for Chinese documents to ' $\footnote{fontsize=\mall, formatcom=\xeCJKVerbAddon}'}$

Keys that are set by other options and therefore should not be overridden are:

```
'docclass' 'classoptions' 'title' 'release' 'author'
```

6.2 The sphinxsetup configuration setting

New in version 1.5.

The 'sphinxsetup' key of *latex_elements* provides a LaTeX-type customization interface:

```
latex_elements = {
    'sphinxsetup': 'key1=value1, key2=value2, ...',
}
```

It defaults to empty. If non-empty, it will be passed as argument to the \sphinxsetup macro inside the document preamble, like this:

```
\usepackage{sphinx}
\sphinxsetup{key1=value1, key2=value2,...}
```

The colors used in the above are provided by the svgnames option of the "xcolor" package:

```
latex_elements = {
    'passoptionstopackages': r'\PassOptionsToPackage{svgnames}{xcolor}',
}
```

It is possible to insert uses of the \sphinxsetup LaTeX macro directly into the body of the document, via the raw directive. This chapter is styled in the PDF output using the following insertion at its start. This uses keys described later in Additional CSS-like 'sphinxsetup' keys.

```
.. raw:: latex
  \begingroup
  \sphinxsetup{%
    TitleColor={named}{DarkGoldenrod},
    % pre_border-width is 5.1.0 alias for verbatimborder
    pre_border-width=2pt,
    pre_border-right-width=8pt,
    % pre_padding is a 5.1.0 alias for verbatimsep
    pre_padding=5pt,
    % Rounded boxes are new at 5.1.0
    pre_border-radius=5pt,
```

(continues on next page)

(continued from previous page)

```
% TeXcolor reminds that syntax must be as for LaTeX \definecolor
pre_background-TeXcolor={named}{OldLace},
% ... and since 5.3.0 also xcolor \colorlet syntax is accepted and we
      can thus drop the {named}{...} thing if xcolor is available!
pre_border-TeXcolor=Gold,
% ... and even take more advantage of xcolor syntax:
pre_border-TeXcolor=Gold!90,
% add a shadow to code-blocks
pre_box-shadow=6pt 6pt.
pre_box-shadow-TeXcolor=gray!20,
% This 5.1.0 CSS-named option is alias for warningborder
div.warning_border-width=3pt,
% Prior to 5.1.0, padding for admonitions was not customizable
div.warning_padding=6pt,
div.warning_padding-right=18pt,
div.warning_padding-bottom=18pt,
% Assume xcolor has been loaded with its sygnames option
div.warning_border-TeXcolor=DarkCyan,
div.warning_background-TeXcolor=LightCyan,
% This one is the only option with space separated input:
div.warning_box-shadow=-12pt -12pt inset,
div.warning_box-shadow-TeXcolor=Cyan,
% The 5.1.0 new name would be div.attention_border-width
attentionborder=3pt.
% The 5.1.0 name here would be div.attention_border-TeXcolor
attentionBorderColor=Crimson,
% The 5.1.0 name would be div.attention_background-TeXcolor
attentionBgColor=FloralWhite,
% For note/hint/important/tip, the CSS syntax was added at 6.2.0
% Legacy syntax still works
noteborder=1pt,
noteBorderColor=Olive,
% But setting a background color via the new noteBgColor means that
% it will be rendered using the same interface as warning type
noteBgColor=Olive!10,
% We can customize separately the four border-widths, and mimic
% the legacy "light" rendering, but now with a background color:
% div.note_border-left-width=0pt,
% div.note_border-right-width=0pt,
% Let's rather for variety use lateral borders:
div.note_border-top-width=0pt,
div.note_border-bottom-width=0pt.
% As long as only border width and border color are set, *and* using
% for this the old interface, the rendering will be the "light" one
hintBorderColor=LightCoral.
% but if we had used div.hint_border-TeXcolor or *any* CSS-named
% option we would have triggered the more complex "heavybox" code.
```

(continues on next page)

(continued from previous page)

}

And this is placed at the end of the chapter source to end the scope of the configuration:

```
.. raw:: latex
\endgroup
```

LaTeX syntax for boolean keys requires *lowercase* true or false e.g 'sphinxsetup': "verbatimwrapslines=false". If setting the boolean key to true, =true is optional. Spaces around the commas and equal signs are ignored, spaces inside LaTeX macros may be significant. Do not use quotes to enclose values, whether numerical or strings.

bookmarksdepth

Controls the depth of the collapsible bookmarks panel in the PDF. May be either a number (e.g. 3) or a LaTeX sectioning name (e.g. subsubsection, i.e. without backslash). For details, refer to the hyperref LaTeX docs.

Default: 5

New in version 4.0.0.

hmargin, vmargin

The dimensions of the horizontal (resp. vertical) margins, passed as hmargin (resp. vmargin) option to the geometry package. Example:

```
'sphinxsetup': 'hmargin={2in,1.5in}, vmargin={1.5in,2in}, marginpar=1in',
```

Japanese documents currently accept only the one-dimension format for these parameters. The geometry package is then passed suitable options to get the text width set to an exact multiple of the *zenkaku* width, and the text height set to an integer multiple of the baselineskip, with the closest fit for the margins.

Default: 1in (equivalent to {1in, 1in})

Hint: For Japanese 'manual' docclass with pointsize 11pt or 12pt, use the nomag extra document class option (cf. 'extraclassoptions' key of *latex_elements*) or so-called TeX "true" units:

```
'sphinxsetup': 'hmargin=1.5truein, vmargin=1.5truein, marginpar=5zw',
```

New in version 1.5.3.

marginpar

The \marginparwidth LaTeX dimension. For Japanese documents, the value is modified to be the closest integer multiple of the *zenkaku* width.

Default: 0.5in

New in version 1.5.3.

verbatimwithframe

Boolean to specify if *code-blocks* and literal includes are framed. Setting it to false does not deactivate use of package "framed", because it is still in use for the optional background color.

Default: true.

verbatimwrapslines

Boolean to specify if long lines in *code-block*'s contents are wrapped.

If true, line breaks may happen at spaces (the last space before the line break will be rendered using a special symbol), and at ascii punctuation characters (i.e. not at letters or digits). Whenever a long string has no break points, it is moved to next line. If its length is longer than the line width it will overflow.

Default: true

verbatimforcewraps

Boolean to specify if long lines in *code-block*'s contents should be forcefully wrapped to never overflow due to long strings.

Note: It is assumed that the Pygments⁴¹⁰ LaTeXFormatter has not been used with its texcomments or similar options which allow additional (arbitrary) LaTeX mark-up.

Also, in case of <code>latex_engine</code> set to 'pdflatex', only the default LaTeX handling of Unicode code points, i.e. utf8 not utf8x is allowed.

Default: false

New in version 3.5.0.

verbatimmaxoverfull

A number. If an unbreakable long string has length larger than the total linewidth plus this number of characters, and if verbatimforcewraps mode is on, the input line will be reset using the forceful algorithm which applies breakpoints at each character.

Default: 3

New in version 3.5.0.

verbatimmaxunderfull

A number. If verbatimforcewraps mode applies, and if after applying the line wrapping at spaces and punctuation, the first part of the split line is lacking at least that number of characters to fill the available width, then the input line will be reset using the forceful algorithm.

As the default is set to a high value, the forceful algorithm is triggered only in overfull case, i.e. in presence of a string longer than full linewidth. Set this to 0 to force all input lines to be hard wrapped at the current available linewidth:

```
latex_elements = {
    'sphinxsetup': "verbatimforcewraps, verbatimmaxunderfull=0",
}
```

This can be done locally for a given code-block via the use of raw latex directives to insert suitable \sphinxsetup (before and after) into the latex file.

Default: 100

New in version 3.5.0.

verbatimhintsturnover

Boolean to specify if code-blocks display "continued on next page" and "continued from previous page" hints in case of page breaks.

Default: true

⁴¹⁰ https://pygments.org/

New in version 1.6.3.

Changed in version 1.7: the default changed from false to true.

verbatimcontinuedalign, verbatimcontinuesalign

Horizontal position relative to the framed contents: either 1 (left aligned), r (right aligned) or c (centered).

Default: r

New in version 1.7.

parsedliteralwraps

Boolean to specify if long lines in parsed-literal⁴¹¹'s contents should wrap.

Default: true

New in version 1.5.2: set this option value to false to recover former behavior.

inlineliteralwraps

Boolean to specify if line breaks are allowed inside inline literals: but extra potential break-points (additionally to those allowed by LaTeX at spaces or for hyphenation) are currently inserted only after the characters . , ; ? ! / and \. Due to TeX internals, white space in the line will be stretched (or shrunk) in order to accommodate the linebreak.

Default: true

New in version 1.5: set this option value to false to recover former behavior.

Changed in version 2.3.0: added potential breakpoint at \ characters.

verbatimvisiblespace

When a long code line is split, the last space character from the source code line right before the linebreak location is typeset using this.

Default: \textcolor{red}{\textvisiblespace}

verbatimcontinued

A LaTeX macro inserted at start of continuation code lines. Its (complicated...) default typesets a small red hook pointing to the right:

\makebox[2\fontcharwd\font`\x][r]{\textcolor{red}{\tiny\$\hookrightarrow\$}}

Changed in version 1.5: The breaking of long code lines was added at 1.4.2. The default definition of the continuation symbol was changed at 1.5 to accommodate various font sizes (e.g. code-blocks can be in footnotes).

Note: Values for color keys must either:

- obey the syntax of the \definecolor LaTeX command, e.g. something such as VerbatimColor={rgb}{0.2,0.3,0.5} or {RGB}{37,23,255} or {gray}{0.75} or (only with package xcolor) {HTML}{808080} or ...
- or obey the syntax of the \colorlet command from package xcolor (which then must exist in the LaTeX installation), e.g. VerbatimColor=red!10 or red!50!green or -red!75 or MyPreviouslyDefinedColor or... Refer to xcolor documentation for this syntax.

Changed in version 5.3.0: Formerly only the \definecolor syntax was accepted.

⁴¹¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#parsed-literal

⁴¹² https://ctan.org/pkg/xcolor

TitleColor

The color for titles (as configured via use of package "titlesec".)

Default: {rgb}{0.126,0.263,0.361}

InnerLinkColor

A color passed to hyperref as value of linkcolor and citecolor.

Default: {rgb}{0.208,0.374,0.486}.

OuterLinkColor

A color passed to hyperref as value of filecolor, menucolor, and urlcolor.

Default: {rgb}{0.216,0.439,0.388}

VerbatimColor

The background color for *code-blocks*.

Default: {gray}{0.95}

Changed in version 6.0.0: Formerly, it was {rgb}{1,1,1} (white).

VerbatimBorderColor

The frame color.

Default: {RGB}{32,32,32}

Changed in version 6.0.0: Formerly it was {rgb}{0,0,0} (black).

VerbatimHighlightColor

The color for highlighted lines.

Default: {rgb}{0.878,1,1}

New in version 1.6.6.

TableRowColorHeader

Sets the background color for (all) the header rows of tables.

It will have an effect only if either the <code>latex_table_style</code> contains 'colorrows' or if the table is assigned the colorrows class. It is ignored for tables with nocolorrows class.

As for the other 'sphinxsetup' keys, it can also be set or modified from a \sphinxsetup{...} LaTeX command inserted via the raw⁴¹³ directive, or also from a LaTeX environment associated to a *container class* and using such \sphinxsetup{...}.

Default: {gray}{0.86}

There is also TableMergeColorHeader. If used, sets a specific color for merged single-row cells in the header.

New in version 5.3.0.

TableRowColorOdd

Sets the background color for odd rows in tables (the row count starts at 1 at the first non-header row). Has an effect only if the <code>latex_table_style</code> contains 'colorrows' or for specific tables assigned the colorrows class.

Default: {gray}{0.92}

There is also TableMergeColorOdd.

New in version 5.3.0.

⁴¹³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#raw

TableRowColorEven

Sets the background color for even rows in tables.

Default {gray}{0.98}

There is also TableMergeColorEven.

New in version 5.3.0.

verbatimsep

The separation between code lines and the frame.

See Additional CSS-like 'sphinxsetup' keys for its alias pre_padding and additional keys.

Default: \fboxsep

verbatimborder

The width of the frame around code-blocks. See also Additional CSS-like 'sphinxsetup' keys for pre_border-width.

Default: \fboxrule

shadowsep

The separation between contents and frame for contents⁴¹⁴ and topic⁴¹⁵ boxes.

See Additional CSS-like 'sphinxsetup' keys for the alias div.topic_padding.

Default: 5pt

shadowsize

The width of the lateral "shadow" to the right and bottom.

See Additional CSS-like 'sphinxsetup' keys for div.topic_box-shadow which allows to configure separately the widths of the vertical and horizontal shadows.

Default: 4pt

Changed in version 6.1.2: Fixed a regression introduced at 5.1.0 which modified unintentionally the width of topic boxes and worse had made usage of this key break PDF builds.

shadowrule

The width of the frame around $topic^{416}$ boxes. See also *Additional CSS-like 'sphinxsetup' keys* for div. $topic_border_width$.

Default: \fboxrule

$note Border Color, \verb|hintBorder Color|, \verb|importantBorder Color|, \verb|tipBorder Color|$

The color for the two horizontal rules used by Sphinx in LaTeX for styling a note⁴¹⁷ type admonition.

Default: {rgb}{0,0,0} (black)

noteBgColor, hintBgColor, importantBgColor, tipBgColor

The optional color for the background. It is a priori set to white, but is not used, unless it has been set explicitly, and doing this triggers Sphinx into switching to the more complex LaTeX code which is employed also for warning type admonitions. There are then additional options which are described in *Additional CSS-like 'sphinxsetup' keys*.

Default: {rgb}{1,1,1} (white)

New in version 6.2.0.

 $^{^{414}\} https://docutils.sourceforge.io/docs/ref/rst/directives.html\#table-of-contents$

⁴¹⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴¹⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴¹⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

noteTextColor, hintTextColor, importantTextColor, tipTextColor

The optional color for the contents.

Default: unset (uses ambient text color, a priori black)

New in version 6.2.0: To be considered experimental until 7.0.0. These options have aliases div. note_TeXcolor (etc) described in *Additional CSS-like 'sphinxsetup' keys*. Using the latter will let Sphinx switch to a more complex LaTeX code, which supports the customizability described in *Additional CSS-like 'sphinxsetup' keys*.

noteTeXextras, hintTeXextras, importantTeXextras, tipTeXextras

Some extra LaTeX code (such as \bfseries or \footnotesize) to be executed at start of the contents.

Default: empty

New in version 6.2.0: To be considered experimental until 7.0.0. These options have aliases div. note_TeXextras (etc) described in *Additional CSS-like 'sphinxsetup' keys*.

noteborder, hintborder, importantborder, tipborder

The width of the two horizontal rules.

If the background color is set, or the alternative *Additional CSS-like 'sphinxsetup' keys* syntax is used (e.g. div. note_border-width=1pt in place of noteborder=1pt), or *any* option with a CSS-alike name is used, then the border is a full frame and this parameter sets its width also for left and right.

Default: 0.5pt

warningBorderColor, and (caution|attention|danger|error)BorderColor

The color for the admonition frame.

Default: {rgb}{0,0,0} (black)

warningBgColor, cautionBgColor, attentionBgColor, dangerBgColor, errorBgColor

The background colors for the respective admonitions.

Default: {rgb}{1,1,1} (white)

warningborder, cautionborder, attentionborder, dangerborder, errorborder

The width of the frame. See Additional CSS-like 'sphinxsetup' keys for keys allowing to configure separately each border width.

Default: 1pt

AtStartFootnote

LaTeX macros inserted at the start of the footnote text at bottom of page, after the footnote number.

Default: \mbox{ }

BeforeFootnote

LaTeX macros inserted before the footnote mark. The default removes possible space before it (else, TeX could insert a line break there).

Default: \leavevmode\unskip

New in version 1.5.

HeaderFamily

default \sffamily\bfseries. Sets the font used by headings.

6.3 Additional CSS-like 'sphinxsetup' keys

New in version 5.1.0: For code-block, topic⁴¹⁸ and contents⁴¹⁹ directive, and strong-type admonitions (warning⁴²⁰, error⁴²¹, ...).

New in version 6.2.0: Also the note⁴²², hint⁴²³, important⁴²⁴ and tip⁴²⁵ admonitions can be styled this way. Using for them *any* of the listed options will trigger usage of a more complex LaTeX code than the one used per default (sphinxheavybox vs sphinxlightbox). Setting the new noteBgColor (or hintBgColor, ...) also triggers usage of sphinxheavybox for note⁴²⁶ (or hint⁴²⁷, ...).

Perhaps in future these 5.1.0 (and 6.2.0) novel settings will be optionally imported from some genuine CSS external file, but currently they have to be used via the 'sphinxsetup' interface (or the \sphinxsetup LaTeX command inserted via the raw⁴²⁸ directive) and the CSS syntax is only imitated.

Important: Low-level LaTeX errors causing a build failure can happen if the input syntax is not respected.

• In particular colors must be input as for the other color related options previously described, i.e. either in the \definecolor syntax or, if package xcolor is available (it is then automatically used) also the \colorlet syntax:

```
...<other options>
div.warning_border-TeXcolor={rgb}{1,0,0},% (always works)
div.error_background-TeXcolor=red!10,% (works only if xcolor is available)
...<other options>
```

- A colon in place of the equal sign will break LaTeX.
- ...border-width or ...padding expect a *single* dimension: they can not be used so far with space separated dimensions.
- ...top-right-radius et al. values may be either a single or two space separated dimensions.
- Dimension specifications must use TeX units such as pt or cm or in. The px unit is recognized by pdflatex and lualatex but not by xelatex or platex.
- It is allowed for such specifications to be so-called "dimensional expressions", e.g. \fboxsep+2pt or 0.5\ baselineskip are valid inputs. The expressions will be evaluated only at the typesetting time. Be careful though if using as in these examples TeX control sequences to double the backslash or to employ a raw Python string for the value of the 'sphinxsetup' key.
- As a rule, avoid inserting unneeded spaces in the key values: especially for the radii an input such 2 pt 3pt will break LaTeX. Beware also that \fboxsep \fboxsep will not be seen as space separated in LaTeX. You must use something such as {\fboxsep} \fboxsep. Or use directly 3pt 3pt which is a priori equivalent and simpler.

⁴¹⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴¹⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴²⁰ https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴²¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#error

⁴²² https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

⁴²³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#hint

⁴²⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#important

⁴²⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#tip

⁴²⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

⁴²⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#hint

⁴²⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#raw

The options are all named in a similar pattern which depends on a prefix, which is then followed by an underscore, then the property name.

| Directive | Option prefix | LaTeX environment |
|-------------------------|------------------------------|---|
| code-block | pre | sphinxVerbatim |
| topic ⁴²⁹ | div.topic | sphinxShadowBox |
| contents ⁴³⁰ | div.topic | sphinxShadowBox |
| note ⁴³¹ | div.note | sphinxnote using sphinxheavybox |
| warning ⁴³² | div.warning | <pre>sphinxwarning (uses sphinxheavybox)</pre> |
| admonition type | <pre>div.<type></type></pre> | <pre>sphinx<type> (using sphinxheavybox)</type></pre> |

Here are now these options as well as their common defaults. Replace below prefix by the actual prefix as explained above. Don't forget the underscore separating the prefix from the property names.

- refix>_border-top-width, <prefix>_border-right-width,
 - <prefix>_border-bottom-width,
 - <prefix>_border-left-width,

<prefix>_border-width. The latter can (currently) be only a single dimension which then sets all four others.

The default is that all those dimensions are equal. They are set to:

- \fboxrule (i.e. a priori 0.4pt) for code-block,
- \fboxrule for topic⁴³³ or contents⁴³⁴ directive.
- 1pt for warning⁴³⁵ and other "strong" admonitions,
- 0.5pt for note⁴³⁶ and other "light" admonitions. The framing style of the "lighbox" used for them in absence of usage of CSS-named options will be emulated by the richer "heavybox" if setting border-left-width and border-right-width both to Opt.
- fix>_box-decoration-break</pr>
 can be set to either clone or slice and configures the behavior at page breaks. It defaults to slice for code-block (i.e. for pre) since 6.0.0. For other directives the default is clone.
- <prefix>_padding-top,
 - <prefix>_padding-right,
 - <prefix>_padding-bottom,
 - <prefix>_padding-left,
 - <prefix>_padding. The latter can (currently) be only a single dimension which then sets all four others.

The default is that all those dimensions are equal. They are set to:

- \fboxsep (i.e. a priori 3pt) for code-block,
- 5pt for topic⁴³⁷ or contents⁴³⁸ directive,

⁴²⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴³⁰ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴³¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

⁴³² https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴³³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴³⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴³⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴³⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

⁴³⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴³⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

a special value for warning⁴³⁹ and other "strong" admonitions, which ensures a backward compatible behavior.

Important: Prior to 5.1.0 there was no separate customizability of padding for warning-type boxes in PDF via LaTeX output. The sum of padding and border-width (as set for example for warning⁴⁴⁰ by warningborder, now also named div.warning_border-width) was kept to a certain constant value. This limited the border-width to small values else the border could overlap the text contents. This behavior is kept as default.

- the same padding behavior is obeyed per default for note⁴⁴¹ or other "light" admonitions when using sphinxheavybox.
- refix>_border-top-left-radius,

```
<prefix>_border-top-right-radius,
```

<prefix>_border-bottom-right-radius,

<prefix>_border-bottom-left-radius,

<prefix>_border-radius. This last key sets the first four to its assigned value. Each key value can be either
a single, or two, dimensions which are then space separated.

The default is that all four corners are either circular or straight, with common radii:

- \fboxsep (i.e. a priori 3pt) for *code-block* (since 6.0.0).
- Opt for all other directives; this means to use straight corners.

See a remark above about traps with spaces in LaTeX.

- erix>_box-shadow is special in so far as it may be:
 - the none keyword,
 - or a single dimension (giving both x-offset and y-offset),
 - or two dimensions (separated by a space),
 - or two dimensions followed by the keyword inset.

The x-offset and y-offset may be negative. The default is none, *except* for the topic⁴⁴² or contents⁴⁴³ directives, for which it is 4pt 4pt, i.e. the shadow has a width of 4pt and extends to the right and below the frame. The lateral shadow then extends into the page right margin.

• refix>_border-TeXcolor,

```
<prefix>_background-TeXcolor,
```

<prefix>_box-shadow-TeXcolor,

TeXcolor. These are colors.

The shadow color defaults in all cases to $\{rgb\}\{0,0,0\}$ i.e. to black.

Since 6.0.0 the border color and background color of *code-block*, i.e. pre prefix, default respectively to {RGB}{32,32,32} and {gray}{0.95}. They previously defaulted to black, respectively white.

For all other types, the border color defaults to black and the background color to white.

The refix>_TeXcolor stands for the CSS property "color", i.e. it influences the text color of the contents.
As for the three other options, the naming TeXcolor is to stress that the input syntax is the TeX one for colors

⁴³⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴⁴⁰ https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴⁴¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#note

⁴⁴² https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

⁴⁴³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

not an HTML/CSS one. If package xcolor is available in the LaTeX installation, one can use directly named colors as key values. Consider passing options such as dvipsnames, svgnames or x11names to xcolor via 'passoptionstopackages' key of latex_elements.

If refix>_TeXcolor is set, a \color command is inserted at start of the directive contents; for admonitions,
this happens after the heading which reproduces the admonition type.

Note:

• All directives support box-decoration-break to be set to slice.

Changed in version 6.2.0: Formerly, only *code-block* did. The default remains clone for all other directives, but this will probably change at 7.0.0.

• The corners of rounded boxes may be elliptical.

Changed in version 6.2.0: Formerly, only circular rounded corners were supported and a rounded corner forced the whole frame to use the same constant width from cprefix>_border-width.

• Inset shadows are incompatible with rounded corners. In case both are specified the inset shadow will simply be ignored.

Changed in version 6.2.0: Formerly it was to the contrary the rounded corners which were ignored in case an inset shadow was specified.

• fix>_TeXcolor and fix>_TeXextras are new with 6.2.0.

Usefulness is doubtful in the case of code-block:

- pre_TeXcolor will influence only the few non-Pygments highlighted tokens; it does color the line numbers, but if one wants to color *only* them one has to go through the fancyvrb interface.
- pre_TeXextras=\footnotesize for example may be replaced by usage of the latex_elements
 key 'fvset'. For 'lualatex' or 'xelatex' Sphinx includes in the preamble already \
 fvset{fontsize=\small} and this induces fancyvrb into overriding a \footnotesize coming
 from pre_TeXextras. One has to use pre_TeXextras=\fvset{fontsize=\footnotesize} syntax. Simpler to set directly the latex_elements key 'fvset'...

Consider these options experimental and that some implementation details may change. For example if the pre_TeXextras LaTeX commands were put by Sphinx in another location it could override the 'fvset' effect, perhaps this is what will be done in a future release.

- Rounded boxes are done using the pict2e⁴⁴⁴ interface to some basic PDF graphics operations. If this LaTeX package can not be found the build will proceed and render all boxes with straight corners.
- Elliptic corners use the ellipse⁴⁴⁵ LaTeX package which extends pict2e⁴⁴⁶. If this LaTeX package can not be found rounded corners will be circular arcs (or straight if pict2e⁴⁴⁷ is not available).

The following legacy behavior is currently not customizable:

• For *code-block*, padding and border-width and shadow (if one adds one) will go into the margin; the code lines remain at the same place independently of the values of the padding and border-width, except for being shifted vertically of course to not overwrite other text due to the width of the border or external shadow.

⁴⁴⁴ https://ctan.org/pkg/pict2e

⁴⁴⁵ https://ctan.org/pkg/ellipse

⁴⁴⁶ https://ctan.org/pkg/pict2e

⁴⁴⁷ https://ctan.org/pkg/pict2e

- For topic⁴⁴⁸ (and contents⁴⁴⁹) the shadow (if on right) goes into the page margin, but the border and the extra padding are kept within the text area. Same for admonitions.
- The contents⁴⁵⁰ and topic⁴⁵¹ directives are governed by the same options with div.topic prefix: the Sphinx LaTeX mark-up uses for both directives the same sphinxShadowBox environment which has currently no additional branching, contrarily to the sphinxadmonition environment which branches according to the admonition directive name, e.g. either to sphinxnote or sphinxwarning etc...

6.4 LaTeX macros and environments

The "LaTeX package" file sphinx.sty loads various components providing support macros (aka commands), and environments, which are used in the mark-up produced on output from the latex builder, before conversion to pdf via the LaTeX toolchain. Also the "LaTeX class" files sphinxhowto.cls and sphinxmanual.cls define or customize some environments. All of these files can be found in the latex build repertory.

Some of these provide facilities not available from pre-existing LaTeX packages and work around LaTeX limitations with lists, table cells, verbatim rendering, footnotes, etc...

Others simply define macros with public names to make overwriting their defaults easy via user-added contents to the preamble. We will survey most of those public names here, but defaults have to be looked at in their respective definition files.

Hint: Sphinx LaTeX support code is split across multiple smaller-sized files. Rather than adding code to the preamble via *latex_elements*['preamble'] it is also possible to replace entirely one of the component files of Sphinx LaTeX code with a custom version, simply by including a modified copy in the project source and adding the filename to the *latex_additional_files* list. Check the LaTeX build repertory for the filenames and contents.

Changed in version 4.0.0: split of sphinx.sty into multiple smaller units, to facilitate customization of many aspects simultaneously.

Macros

• Text styling commands:

| Name | maps argument #1 to: |
|-----------------------|-------------------------------------|
| \sphinxstrong | \textbf{#1} |
| \sphinxcode | \texttt{#1} |
| \sphinxbfcode | <pre>\textbf{\sphinxcode{#1}}</pre> |
| \sphinxemail | \textsf{#1} |
| \sphinxtablecontinued | \textsf{#1} |
| \sphinxtitleref | \emph{#1} |
| \sphinxmenuselection | \emph{#1} |
| \sphinxguilabel | \emph{#1} |
| \sphinxkeyboard | \sphinxcode{#1} |
| \sphinxaccelerator | \underline{#1} |
| \sphinxcrossref | \emph{#1} |

continues on next page

 $^{^{448}\} https://docutils.sourceforge.io/docs/ref/rst/directives.html\#topic$

⁴⁴⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴⁵⁰ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴⁵¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

Table 1 – continued from previous page

| Name | maps argument #1 to: |
|-------------------|---------------------------------------|
| \sphinxtermref | \emph{#1} |
| \sphinxsamedocref | \emph{#1} |
| \sphinxparam | \emph{#1} |
| \sphinxtypeparam | \emph{#1} |
| \sphinxoptional | [#1] with larger brackets, see source |

New in version 1.4.5: Use of \sphinx prefixed macro names to limit possibilities of conflict with LaTeX packages.

New in version 1.8: \sphinxguilabel

New in version 3.0: \sphinxkeyboard

New in version 6.2.0: \sphinxparam, \sphinxsamedocref

New in version 7.1.0: \sphinxparamcomma which defaults to a comma followed by a space and \sphinxparamcommaoneperline which is used for one-parameter-per-line signatures (see maximum_signature_line_length). It defaults to \texttt{,} to make these end-of-line separators more distinctive.

Signatures of Python functions are rendered as name<space>(parameters) or name<space>[type parameters]<space>(parameters) (see PEP 695⁴⁵²) where the length of <space> is set to Opt by default. This can be changed via \setlength{\sphinxsignaturelistskip}{1ex} for instance.

• More text styling:

| Name | maps argument #1 to: |
|-------------------------------------|---|
| \sphinxstyleindexentry | \texttt{#1} |
| \sphinxstyleindexextra | (\emph{#1}) (with a space upfront) |
| \sphinxstyleindexpageref | , \pageref{#1} |
| \sphinxstyleindexpagemain | \textbf{#1} |
| \sphinxstyleindexlettergroup | {\Large\sffamily#1}\nopagebreak\vspace{1mm} |
| \sphinxstyleindexlettergroupDefault | check source, too long for here |
| \sphinxstyletopictitle | \textbf{#1}\par\medskip |
| \sphinxstylesidebartitle | \textbf{#1}\par\medskip |
| \sphinxstyleothertitle | \textbf{#1} |
| \sphinxstylesidebarsubtitle | ~\\\textbf{#1} \smallskip |
| \sphinxstyletheadfamily | \sffamily (this one has no argument) |
| \sphinxstyleemphasis | \emph{#1} |
| \sphinxstyleliteralemphasis | \emph{\sphinxcode{#1}} |
| \sphinxstylestrong | \textbf{#1} |
| \sphinxstyleliteralstrong | \sphinxbfcode{#1} |
| \sphinxstyleabbreviation | \textsc{#1} |
| \sphinxstyleliteralintitle | \sphinxcode{#1} |
| \sphinxstylecodecontinued | <pre>{\footnotesize(#1)}}</pre> |
| \sphinxstylecodecontinues | <pre>{\footnotesize(#1)}}</pre> |
| \sphinxstylenotetitle | \sphinxstrong{#1} <space></space> |
| \sphinxstylehinttitle | idem |
| \sphinxstyleimportanttitle | idem |
| \sphinxstyletiptitle | idem |

continues on next page

⁴⁵² https://peps.python.org/pep-0695/

Table 2 – continued from previous page

| Name | maps argument #1 to: |
|----------------------------|-----------------------------------|
| \sphinxstylewarningtitle | idem |
| \sphinxstylecautiontitle | idem |
| \sphinxstyleattentiontitle | idem |
| \sphinxstyledangertitle | idem |
| \sphinxstyleerrortitle | idem |
| \sphinxstyleseealsotitle | \sphinxstrong{#1}\par\nopagebreak |

New in version 1.5: These macros were formerly hard-coded as non customizable \textt, \emph, etc...

New in version 1.6: \sphinxstyletheadfamily which defaults to \sffamily and allows multiple paragraphs in header cells of tables.

New in version 1.6.3: \sphinxstylecodecontinued and \sphinxstylecodecontinues.

New in version 1.8: \sphinxstyleindexlettergroup, \sphinxstyleindexlettergroupDefault.

New in version 6.2.0: \sphinxstylenotetitle et al. The #1 is the localized name of the directive, with a final colon. Wrap it as \sphinxremovefinalcolon{#1} if this final colon is to be removed. Examples:

```
\renewcommand\sphinxstylewarningtitle[1]{%
   \underline{\textbf{\sphinxremovefinalcolon{#1}}}\par
}
\renewcommand{\sphinxstylenotetitle}[1]{%
   \textit{\textbf{\sphinxremovefinalcolon{#1}}}\par\nobreak
   % LaTeX syntax is complex and we would be better off using \hrule.
   {\parskipOpt\noindent}%
   \raisebox{1ex}%
   {\makebox[\linewidth]{\textcolor{sphinxnoteBorderColor}{\dotfill}}}
% It is complex to obtain nice vertical spacing for both a paragraph
   % or a list following up; this set-up is better for a paragraph next.
   \par\vskip-\parskip
}
```

• \sphinxtableofcontents: A wrapper (defined differently in sphinxhowto.cls and in sphinxmanual. cls) of standard \tableofcontents. The macro \sphinxtableofcontentshook is executed during its expansion right before \tableofcontents itself.

Changed in version 1.5: Formerly, the meaning of \tableofcontents was modified by Sphinx.

Changed in version 2.0: Hard-coded redefinitions of \l@section and \l@subsection formerly done during loading of 'manual' docclass are now executed later via \sphinxtableofcontentshook. This macro is also executed by the 'howto' docclass, but defaults to empty with it.

Hint: If adding to preamble the loading of tocloft package, also add to preamble \renewcommand\ sphinxtableofcontentshook{} else it will reset \l@section and \l@subsection cancelling tocloft customization.

• \sphinxmaketitle: Used as the default setting of the 'maketitle' *latex_elements* key. Defined in the class files sphinxmanual.cls and sphinxhowto.cls.

Changed in version 1.8.3: Formerly, \maketitle from LaTeX document class was modified by Sphinx.

• \sphinxbackoftitlepage: For 'manual' docclass, and if it is defined, it gets executed at end of \sphinxmaketitle, before the final \clearpage. Use either the 'maketitle' key or the 'preamble' key of latex_elements to add a custom definition of \sphinxbackoftitlepage.

New in version 1.8.3.

• \sphinxcite: A wrapper of standard \cite for citation references.

The \sphinxbox command

New in version 6.2.0.

The \sphinxbox[key=value,...]{inline text} command can be used to "box" inline text elements with all the customizability which has been described in *Additional CSS-like 'sphinxsetup' keys*. It is a LaTeX command with one optional argument, which is a comma-separated list of key=value pairs, as for *The sphinxsetup configuration setting*. Here is the complete list of keys. They don't use any prefix.

- border-width,
- border-top-width, border-right-width, border-bottom-width, border-left-width,
- padding,
- padding-top, padding-right, padding-bottom, padding-left,
- · border-radius,
- border-top-left-radius, border-top-right-radius, border-bottom-left-radius,
- box-shadow.
- border-TeXcolor, background-TeXcolor, box-shadow-TeXcolor, TeXcolor,
- TeXextras,
- and addstrut which is a boolean key, i.e. to be used as addstrut=true, or addstrut alone where =true is omitted, or addstrut=false.

This last key is specific to \sphinxbox and it means to add a \strut so that heights and depths are equalized across various instances on the same line with varying contents. The default is addstrut=false.

Important: Perhaps the default will turn into addstrut=true at 7.0.0 depending on feedback until then.

The combination addstrut, padding-bottom=0pt, padding-top=1pt is often satisfactory.

Refer to *Additional CSS-like 'sphinxsetup' keys* for important syntax information regarding the other keys. The default configuration uses no shadow, a border-width of \fboxrule, a padding of \fboxsep, circular corners with radii \fboxsep and background and border colors as for the default rendering of code-blocks.

When a \sphinxbox usage is nested within another one, it will ignore the options of the outer one: it first resets all options to their default state as they were prior to applying the outer box options, then it applies its own specific ones.

One can modify these defaults via the command \sphinxboxsetup{key=value,...}. The effect is cumulative, if one uses this command multiple times. Here the options are a mandatory argument so are within curly braces, not square brackets.

Here is some example of use:

A utility \newsphinxbox is provided to create a new boxing macro, say \foo which will act exactly like \sphinxbox but with a given extra configuration:

```
% the specific options to \foo are within brackets
\newsphinxbox[border-radius=0pt, box-shadow=2pt 2pt]{\foo}
% then use this \foo, possibly with some extra options still:
\protected\def\sphinxguilabel#1{\foo[#1}}
\protected\def\sphinxmenuselection#1{\foo[box-shadow-TeXcolor=gray]{#1}}
```

Boxes rendered with \foo obey as the ones using directly \sphinxbox the current configuration as set possibly midway in document via \sphinxboxsetup (from a raw⁴⁵³ LaTeX mark-up), the only difference is that they have an initial additional set of default extras.

In the above examples, you can probably use \renewcommand syntax if you prefer it to \protected\def (with [1] in place of #1 then).

Environments

• A figure⁴⁵⁴ may have an optional legend with arbitrary body elements: they are rendered in a sphinxlegend environment. The default definition issues \small, and ends with \par.

New in version 1.5.6: Formerly, the \small was hardcoded in LaTeX writer and the ending \par was lacking.

- Environments associated with admonitions:
 - sphinxnote,
 - sphinxhint,
 - sphinximportant,
 - sphinxtip,
 - sphinxwarning,
 - sphinxcaution,
 - sphinxattention,
 - sphinxdanger,
 - sphinxerror.

⁴⁵³ https://docutils.sourceforge.io/docs/ref/rst/directives.html#raw

⁴⁵⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#figure

They may be \renewenvironment 'd individually, and must then be defined with one argument (it is the heading of the notice, for example Warning: for warning⁴⁵⁵ directive, if English is the document language). Their default definitions use either the *sphinxheavybox* (for the last 5 ones) or the *sphinxlightbox* environments, configured to use the parameters (colors, border thickness) specific to each type, which can be set via 'sphinxsetup' string.

Changed in version 1.5: Use of public environment names, separate customizability of the parameters, such as noteBorderColor, noteborder, warningBgColor, warningBorderColor, warningborder,...

• Environment for the *seealso* directive: sphinxseealso. It takes one argument which will be the localized string See also followed with a colon.

New in version 6.1.0.

Changed in version 6.2.0: Colon made part of the mark-up rather than being inserted by the environment for coherence with how admonitions are handled generally.

• The contents⁴⁵⁶ directive (with :local: option) and the topic⁴⁵⁷ directive are implemented by environment sphinxShadowBox.

New in version 1.4.2: Former code refactored into an environment allowing page breaks.

Changed in version 1.5: Options shadowsep, shadowsize, shadowrule.

• The literal blocks (via :: or *code-block*), are implemented using sphinxVerbatim environment which is a wrapper of Verbatim environment from package fancyvrb.sty. It adds the handling of the top caption and the wrapping of long lines, and a frame which allows page breaks. Inside tables the used environment is sphinxVerbatimintable (it does not draw a frame, but allows a caption).

Changed in version 1.5: Verbatim keeps exact same meaning as in fancyvrb.sty (also under the name OriginalVerbatim); sphinxVerbatimintable is used inside tables.

New in version 1.5: Options verbatimwithframe, verbatimwrapslines, verbatimsep, verbatimborder.

New in version 1.6.6: Support for :emphasize-lines: option

New in version 1.6.6: Easier customizability of the formatting via exposed to user LaTeX macros such as \sphinxVerbatimHighlightLine.

• The bibliography uses sphinxthebibliography and the Python Module index as well as the general index both use sphinxtheindex; these environments are wrappers of the thebibliography and respectively theindex environments as provided by the document class (or packages).

Changed in version 1.5: Formerly, the original environments were modified by Sphinx.

Miscellany

• Every text paragraph in document body starts with \sphinxAtStartPar. Currently, this is used to insert a zero width horizontal skip which is a trick to allow TeX hyphenation of the first word of a paragraph in a narrow context (like a table cell). For 'lualatex' which does not need the trick, the \sphinxAtStartPar does nothing.

New in version 3.5.0.

- The section, subsection, ... headings are set using *titlesec*'s \titleformat command.
- For the 'manual' docclass, the chapter headings can be customized using *fncychap*'s commands \ChNameVar, \ChTitleVar. File sphinx.sty has custom re-definitions in case of *fncychap* option Bjarne.

Changed in version 1.5: Formerly, use of *fncychap* with other styles than Bjarne was dysfunctional.

⁴⁵⁵ https://docutils.sourceforge.io/docs/ref/rst/directives.html#warning

⁴⁵⁶ https://docutils.sourceforge.io/docs/ref/rst/directives.html#table-of-contents

⁴⁵⁷ https://docutils.sourceforge.io/docs/ref/rst/directives.html#topic

• Docutils container⁴⁵⁸ directives are supported in LaTeX output: to let a container class with name foo influence the final PDF via LaTeX, it is only needed to define in the preamble an environment sphinxclassfoo. A simple example would be:

\newenvironment{sphinxclassred}{\color{red}}{}

Currently the class names must contain only ascii characters and avoid characters special to LaTeX such as $\$.

New in version 4.1.0.

Hint: As an experimental feature, Sphinx can use user-defined template file for LaTeX source if you have a file named _templates/latex.tex_t in your project.

Additional files longtable.tex_t, tabulary.tex_t and tabular.tex_t can be added to _templates/ to configure some aspects of table rendering (such as the caption position).

New in version 1.6: currently all template variables are unstable and undocumented.

⁴⁵⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#container

SPHINX EXTENSIONS API

Since many projects will need special features in their documentation, Sphinx is designed to be extensible on several levels.

Here are a few things you can do in an extension:

- Add new *builders* to support new output formats or actions on the parsed documents.
- Register custom reStructuredText roles and directives, extending the markup using the *Docutils markup API*.
- Add custom code to so-called "hook points" at strategic places throughout the build process, allowing you to register a hook and run specialized code. For example, see the *Sphinx core events*.

An extension is simply a Python module with a setup() function. A user activates the extension by placing the extension's module name (or a sub-module) in their *extensions* configuration value.

When **sphinx-build** is executed, Sphinx will attempt to import each module that is listed, and execute **yourmodule**. setup(app). This function is used to prepare the extension (e.g., by executing Python code), linking resources that Sphinx uses in the build process (like CSS or HTML files), and notifying Sphinx of everything the extension offers (such as directive or role definitions). The app argument is an instance of *Sphinx* and gives you control over most aspects of the Sphinx build.

Note: The configuration file itself can be treated as an extension if it contains a setup() function. All other extensions to load must be listed in the *extensions* configuration value.

The rest of this page describes some high-level aspects of developing extensions and various parts of Sphinx's behavior that you can control. For some examples of how extensions can be built and used to control different parts of Sphinx, see the *Extension tutorials*.

7.1 Important objects

There are several key objects whose API you will use while writing an extension. These are:

Application

The application object (usually called app) is an instance of *Sphinx*. It controls most high-level functionality, such as the setup of extensions, event dispatching and producing output (logging).

If you have the environment object, the application is available as env.app.

Environment

The build environment object (usually called env) is an instance of *BuildEnvironment*. It is responsible for parsing the source documents, stores all metadata about the document collection and is serialized to disk after each build.

Its API provides methods to do with access to metadata, resolving references, etc. It can also be used by extensions to cache information that should persist for incremental rebuilds.

If you have the application or builder object, the environment is available as app.env or builder.env.

Builder

The builder object (usually called builder) is an instance of a specific subclass of *Builder*. Each builder class knows how to convert the parsed documents into an output format, or otherwise process them (e.g. check external links).

If you have the application object, the builder is available as app.builder.

Config

The config object (usually called config) provides the values of configuration values set in conf.py as attributes. It is an instance of *Config*.

The config is available as app.config or env.config.

To see an example of use of these objects, refer to Extension tutorials.

7.2 Build Phases

One thing that is vital in order to understand extension mechanisms is the way in which a Sphinx project is built: this works in several phases.

Phase 0: Initialization

In this phase, almost nothing of interest to us happens. The source directory is searched for source files, and extensions are initialized. Should a stored build environment exist, it is loaded, otherwise a new one is created.

Phase 1: Reading

In Phase 1, all source files (and on subsequent builds, those that are new or changed) are read and parsed. This is the phase where directives and roles are encountered by docutils, and the corresponding code is executed. The output of this phase is a *doctree* for each source file; that is a tree of docutils nodes. For document elements that aren't fully known until all existing files are read, temporary nodes are created.

There are nodes provided by docutils, which are documented in the docutils documentation⁴⁵⁹. Additional nodes are provided by Sphinx and *documented here*.

During reading, the build environment is updated with all meta- and cross reference data of the read documents, such as labels, the names of headings, described Python objects and index entries. This will later be used to replace the temporary nodes.

The parsed doctrees are stored on the disk, because it is not possible to hold all of them in memory.

Phase 2: Consistency checks

Some checking is done to ensure no surprises in the built documents.

Phase 3: Resolving

Now that the metadata and cross-reference data of all existing documents is known, all temporary nodes are replaced by nodes that can be converted into output using components called transforms. For example, links are created for object references that exist, and simple literal nodes are created for those that don't.

Phase 4: Writing

This phase converts the resolved doctrees to the desired output format, such as HTML or LaTeX. This happens via a so-called docutils writer that visits the individual nodes of each doctree and produces some output in the process.

⁴⁵⁹ https://docutils.sourceforge.io/docs/ref/doctree.html

Note: Some builders deviate from this general build plan, for example, the builder that checks external links does not need anything more than the parsed doctrees and therefore does not have phases 2–4.

To see an example of application, refer to Developing a "TODO" extension.

7.3 Extension metadata

New in version 1.3.

The setup() function can return a dictionary. This is treated by Sphinx as metadata of the extension. Metadata keys currently recognized are:

- 'version': a string that identifies the extension version. It is used for extension version requirement checking (see *needs_extensions*) and informational purposes. If not given, "unknown version" is substituted.
- 'env_version': an integer that identifies the version of env data structure if the extension stores any data to environment. It is used to detect the data structure has been changed from last build. The extensions have to increment the version when data structure has changed. If not given, Sphinx considers the extension does not stores any data to environment.
- 'parallel_read_safe': a boolean that specifies if parallel reading of source files can be used when the extension is loaded. It defaults to False, i.e. you have to explicitly specify your extension to be parallel-read-safe after checking that it is.

Note: The *parallel-read-safe* extension must satisfy the following conditions:

- The core logic of the extension is parallelly executable during the reading phase.
- It has event handlers for env-merge-info and env-purge-doc events if it stores data to the build environment object (env) during the reading phase.
- 'parallel_write_safe': a boolean that specifies if parallel writing of output files can be used when the extension is loaded. Since extensions usually don't negatively influence the process, this defaults to True.

Note: The *parallel-write-safe* extension must satisfy the following conditions:

- The core logic of the extension is parallelly executable during the writing phase.

7.4 APIs used for writing extensions

These sections provide a more complete description of the tools at your disposal when developing Sphinx extensions. Some are core to Sphinx (such as the *Application API*) while others trigger specific behavior (such as the *i18n API*)

Application API

Each Sphinx extension is a Python module with at least a setup() function. This function is called at initialization time with one argument, the application object representing the Sphinx process.

class sphinx.application.Sphinx

This application object has the public API described in the following.

Extension setup

These methods are usually called in an extension's setup() function.

Examples of using the Sphinx extension API can be seen in the sphinx.ext package.

```
Sphinx.setup_extension(extname: str^{460}) \rightarrow None<sup>461</sup>
```

Import and setup a Sphinx extension module.

Load the extension given by the module *name*. Use this if your extension needs the features provided by another extension. No-op if called twice.

```
static Sphinx.require_sphinx(version: tuple^{462}[int^{463}, int^{464}] \mid str^{465}) \rightarrow None<sup>466</sup>
```

Check the Sphinx version if requested.

Compare version with the version of the running Sphinx, and abort the build when it is too old.

version – The required version in the form of major.minor or (major, minor).

New in version 1.0.

Changed in version 7.1: Type of *version* now allows (major, minor) form.

```
Sphinx.connect(event: str^{467}, callback: Callable equation 468, priority: int^{469} = 500) \rightarrow int^{470}
```

Register *callback* to be called when *event* is emitted.

For details on available core events and the arguments of callback functions, please see Sphinx core events.

Parameters

- event The name of target event
- callback Callback function for the event
- **priority** The priority of the callback. The callbacks will be invoked in order of *priority* (ascending).

Returns

A listener ID. It can be used for disconnect().

Changed in version 3.0: Support *priority*

⁴⁶⁰ https://docs.python.org/3/library/stdtypes.html#str

⁴⁶¹ https://docs.python.org/3/library/constants.html#None

⁴⁶² https://docs.python.org/3/library/stdtypes.html#tuple

⁴⁶⁴ https://docs.python.org/3/library/functions.html#int

⁴⁶⁵ https://docs.python.org/3/library/stdtypes.html#str

⁴⁶⁶ https://docs.python.org/3/library/constants.html#None

⁴⁶⁷ https://docs.python.org/3/library/stdtypes.html#str

 $^{^{468}}$ https://docs.python.org/3/library/typing.html#typing.Callable

⁴⁶⁹ https://docs.python.org/3/library/functions.html#int

⁴⁷⁰ https://docs.python.org/3/library/functions.html#int

```
Sphinx.disconnect(listener id: int^{471}) \rightarrow None<sup>472</sup>
```

Unregister callback by listener_id.

Parameters

listener_id – A listener_id that *connect()* returns

```
Sphinx.add_builder(builder: type^{473}[Builder], override: boot^{474} = False) \rightarrow None<sup>475</sup>
```

Register a new builder.

Parameters

- builder A builder class
- override If true, install the builder forcedly even if another builder is already installed as
 the same name

Changed in version 1.8: Add override keyword.

```
Sphinx.add_config_value(name: str^{476}, default: Any^{477}, rebuild: Literal^{478}['', 'env', 'epub', 'gettext', 'html', 'applehelp', 'devhelp'], types: type^{479} \mid Collection^{480}[type^{481}] \mid ENUM = ()) \rightarrow None^{482}
```

Register a configuration value.

This is necessary for Sphinx to recognize new values and set default values accordingly.

Parameters

- name The name of the configuration value. It is recommended to be prefixed with the
 extension name (ex. html_logo, epub_title)
- **default** The default value of the configuration.
- **rebuild** The condition of rebuild. It must be one of those values:
 - 'env' if a change in the setting only takes effect when a document is parsed this means that the whole environment must be rebuilt.
 - 'html' if a change in the setting needs a full rebuild of HTML documents.
 - '' if a change in the setting will not need any special rebuild.
- **types** The type of configuration value. A list of types can be specified. For example, [str] is used to describe a configuration that takes string value.

Changed in version 0.4: If the *default* value is a callable, it will be called with the config object as its argument in order to get the default value. This can be used to implement config values whose default depends on other values.

Changed in version 0.6: Changed *rebuild* from a simple boolean (equivalent to '' or 'env') to a string. However, booleans are still accepted and converted internally.

⁴⁸⁰ https://docs.python.org/3/library/collections.abc.html#collections.abc.Collection

⁴⁸¹ https://docs.python.org/3/library/functions.html#type

⁴⁸² https://docs.python.org/3/library/constants.html#None

```
Sphinx.add_event(name: str^{483}) \rightarrow None<sup>484</sup>
```

Register an event called name.

This is needed to be able to emit it.

Parameters

name – The name of the event

```
Sphinx.set_translator(name: str^{485}, translator\_class: type^{486}[nodes.NodeVisitor], override: bool^{487} = False)
\rightarrow None^{488}
```

Register or override a Docutils translator class.

This is used to register a custom output translator or to replace a builtin translator. This allows extensions to use a custom translator and define custom nodes for the translator (see add_node()).

Parameters

- name The name of the builder for the translator
- translator_class A translator class
- **override** If true, install the translator forcedly even if another translator is already installed as the same name

New in version 1.3.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_node(node: type^{489}[Element], override: bool^{490} = False, **kwargs: tuple^{491}[Callable, Callable | None^{492}I) \rightarrow None^{493}
```

Register a Docutils node class.

This is necessary for Docutils internals. It may also be used in the future to validate nodes in the parsed documents.

Parameters

- **node** A node class
- **kwargs** Visitor functions for each builder (see below)
- **override** If true, install the node forcedly even if another node is already installed as the same name

Node visitor functions for the Sphinx HTML, LaTeX, text and manpage writers can be given as keyword arguments: the keyword should be one or more of 'html', 'latex', 'text', 'man', 'texinfo' or any other supported translators, the value a 2-tuple of (visit, depart) methods. depart can be None if the visit function raises docutils.nodes.SkipNode. Example:

```
class math(docutils.nodes.Element): pass

def visit_math_html(self, node):
    self.body.append(self.starttag(node, 'math'))

def depart_math_html(self, node):
    self.body.append('</math>')
```

(continues on next page)

 $^{^{483}\} https://docs.python.org/3/library/stdtypes.html#str$

⁴⁸⁴ https://docs.python.org/3/library/constants.html#None

 $^{^{485}\} https://docs.python.org/3/library/stdtypes.html\#str$

⁴⁸⁶ https://docs.python.org/3/library/functions.html#type

⁴⁸⁷ https://docs.python.org/3/library/functions.html#bool

⁴⁸⁸ https://docs.python.org/3/library/constants.html#None

(continued from previous page)

```
app.add_node(math, html=(visit_math_html, depart_math_html))
```

Obviously, translators for which you don't specify visitor methods will choke on the node when encountered in a document to translate.

Changed in version 0.5: Added the support for keyword arguments giving visit functions.

```
Sphinx.add_enumerable_node(node: type^{494}[Element], figtype: str^{495}, title\_getter: TitleGetter | None^{496} = None, override: bool^{497} = False, **kwargs: tuple^{498}[Callable, Callable]) \rightarrow None<sup>499</sup>
```

Register a Docutils node class as a numfig target.

Sphinx numbers the node automatically. And then the users can refer it using *numref*.

Parameters

- **node** A node class
- **figtype** The type of enumerable nodes. Each figtype has individual numbering sequences. As system figtypes, **figure**, **table** and **code-block** are defined. It is possible to add custom nodes to these default figtypes. It is also possible to define new custom figtype if a new figtype is given.
- title_getter A getter function to obtain the title of node. It takes an instance of the enumerable node, and it must return its title as string. The title is used to the default title of references for ref. By default, Sphinx searches docutils.nodes.caption or docutils.nodes.title from the node as a title.
- **kwargs** Visitor functions for each builder (same as add_node())
- **override** If true, install the node forcedly even if another node is already installed as the same name

New in version 1.4.

```
Sphinx.add_directive(name: str^{500}, cls: type^{501}[Directive], override: bool^{502} = False) \rightarrow None<sup>503</sup> Register a Docutils directive.
```

Parameters

- name The name of the directive
- cls A directive class
- **override** If false, do not install it if another directive is already installed as the same name If true, unconditionally install the directive.

For example, a custom directive named my-directive would be added like this:

⁴⁸⁹ https://docs.python.org/3/library/functions.html#type

⁴⁹⁰ https://docs.python.org/3/library/functions.html#bool

⁴⁹¹ https://docs.python.org/3/library/stdtypes.html#tuple

⁴⁹² https://docs.python.org/3/library/constants.html#None

⁴⁹³ https://docs.python.org/3/library/constants.html#None

⁴⁹⁴ https://docs.python.org/3/library/functions.html#type

⁴⁹⁵ https://docs.python.org/3/library/stdtypes.html#str

⁴⁹⁶ https://docs.python.org/3/library/constants.html#None

⁴⁹⁷ https://docs.python.org/3/library/functions.html#bool

⁴⁹⁸ https://docs.python.org/3/library/stdtypes.html#tuple

⁴⁹⁹ https://docs.python.org/3/library/constants.html#None

```
from docutils.parsers.rst import Directive, directives

class MyDirective(Directive):
    has_content = True
    required_arguments = 1
    optional_arguments = 0
    final_argument_whitespace = True
    option_spec = {
        'class': directives.class_option,
        'name': directives.unchanged,
    }

    def run(self):
        ...

def setup(app):
    app.add_directive('my-directive', MyDirective)
```

For more details, see the Docutils docs⁵⁰⁴.

Changed in version 0.6: Docutils 0.5-style directive classes are now supported.

Deprecated since version 1.8: Docutils 0.4-style (function based) directives support is deprecated.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_role(name: str^{505}, role: Any^{506}, override: bool^{507} = False) \rightarrow None<sup>508</sup> Register a Docutils role.
```

Parameters

- name The name of role
- role A role function
- **override** If false, do not install it if another role is already installed as the same name If true, unconditionally install the role.

For more details about role functions, see the Docutils docs⁵⁰⁹.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_generic_role(name: str^{510}, nodeclass: Any^{511}, override: bool^{512} = False) \rightarrow None<sup>513</sup> Register a generic Docutils role.
```

Register a Docutils role that does nothing but wrap its contents in the node given by nodeclass.

Parameters

override – If false, do not install it if another role is already installed as the same name If true, unconditionally install the role.

```
    https://docs.python.org/3/library/stdtypes.html#str
    https://docs.python.org/3/library/functions.html#type
    https://docs.python.org/3/library/functions.html#bool
    https://docs.python.org/3/library/constants.html#None
    https://docs.python.org/3/library/constants.html#str
    https://docs.python.org/3/library/stdtypes.html#str
    https://docs.python.org/3/library/typing.html#typing.Any
    https://docs.python.org/3/library/functions.html#bool
```

⁵⁰⁸ https://docs.python.org/3/library/constants.html#None
⁵⁰⁹ https://docutils.sourceforge.io/docs/howto/rst-roles.html

New in version 0.6.

Changed in version 1.8: Add override keyword.

Sphinx.add_domain(domain: $type^{514}[Domain]$, override: $bool^{515} = False$) \rightarrow None⁵¹⁶ Register a domain.

Parameters

- domain A domain class
- **override** If false, do not install it if another domain is already installed as the same name If true, unconditionally install the domain.

New in version 1.0.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_directive_to_domain(domain: str^{517}, name: str^{518}, cls: type^{519}[Directive], override: bool^{520} = False) \rightarrow None^{521}
```

Register a Docutils directive in a domain.

Like add_directive(), but the directive is added to the domain named domain.

Parameters

- domain The name of target domain
- name A name of directive
- cls A directive class
- **override** If false, do not install it if another directive is already installed as the same name If true, unconditionally install the directive.

New in version 1.0.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_role_to_domain(domain: str^{522}, name: str^{523}, role: RoleFunction | XRefRole, override: bool^{524} = False) \rightarrow None<sup>525</sup>
```

Register a Docutils role in a domain.

Like add_role(), but the role is added to the domain named domain.

Parameters

- **domain** The name of the target domain
- name The name of the role
- **role** The role function

⁵¹⁰ https://docs.python.org/3/library/stdtypes.html#str

⁵¹¹ https://docs.python.org/3/library/typing.html#typing.Any

⁵¹² https://docs.python.org/3/library/functions.html#bool

⁵¹³ https://docs.python.org/3/library/constants.html#None

https://docs.python.org/3/library/functions.html#type

⁵¹⁵ https://docs.python.org/3/library/functions.html#bool

⁵¹⁶ https://docs.python.org/3/library/constants.html#None

⁵¹⁷ https://docs.python.org/3/library/stdtypes.html#str

⁵¹⁸ https://docs.python.org/3/library/stdtypes.html#str

⁵¹⁹ https://docs.python.org/3/library/functions.html#type

⁵²⁰ https://docs.python.org/3/library/functions.html#bool

⁵²¹ https://docs.python.org/3/library/constants.html#None

• override – If false, do not install it if another role is already installed as the same name If true, unconditionally install the role.

New in version 1.0.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_index_to_domain(domain: str^{526}, index: type^{527}[Index], override: bool^{528} = False) \rightarrow None<sup>529</sup>
      Register a custom index for a domain.
```

Add a custom *index* class to the domain named *domain*.

Parameters

- **domain** The name of the target domain
- index The index class
- override If false, do not install it if another index is already installed as the same name If true, unconditionally install the index.

New in version 1.0.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_object_type(directivename: str^{530}, rolename: str^{531}, indextemplate: str^{532} = ", parse node:
                                                      Callable<sup>533</sup> | None<sup>534</sup> = None, ref_nodeclass: type<sup>535</sup> [TextElement] | None<sup>536</sup> = None, objname: str^{537} = ", doc_field_types: Sequence<sup>538</sup> = (), override: bool^{539} = False) \rightarrow
```

Register a new object type.

This method is a very convenient way to add a new *object* type that can be cross-referenced. It will do this:

- Create a new directive (called *directivename*) for documenting an object. It will automatically add index entries if *indextemplate* is nonempty; if given, it must contain exactly one instance of %s. See the example below for how the template will be interpreted.
- Create a new role (called *rolename*) to cross-reference to these object descriptions.
- If you provide parse_node, it must be a function that takes a string and a docutils node, and it must populate the node with children parsed from the string. It must then return the name of the item to be used in crossreferencing and index entries. See the conf.py file in the source for this documentation for an example.
- The *objname* (if not given, will default to *directivename*) names the type of object. It is used when listing objects, e.g. in search results.

For example, if you have this call in a custom Sphinx extension:

```
app.add_object_type('directive', 'dir', 'pair: %s; directive')
```

you can use this markup in your documents:

⁵²² https://docs.python.org/3/library/stdtypes.html#str

⁵²³ https://docs.python.org/3/library/stdtypes.html#str

⁵²⁴ https://docs.python.org/3/library/functions.html#bool

⁵²⁵ https://docs.python.org/3/library/constants.html#None

⁵²⁶ https://docs.python.org/3/library/stdtypes.html#str

⁵²⁷ https://docs.python.org/3/library/functions.html#type

⁵²⁸ https://docs.python.org/3/library/functions.html#bool

⁵²⁹ https://docs.python.org/3/library/constants.html#None

```
.. rst:directive:: function
   Document a function.
<...>
See also the :rst:dir:`function` directive.
```

For the directive, an index entry will be generated as if you had prepended

```
.. index:: pair: function; directive
```

The reference node will be of class literal (so it will be rendered in a proportional font, as appropriate for code) unless you give the ref_nodeclass argument, which must be a docutils node class. Most useful are docutils. nodes.emphasis or docutils.nodes.strong - you can also use docutils.nodes.generated if you want no further text decoration. If the text should be treated as literal (e.g. no smart quote replacement), but not have typewriter styling, use sphinx.addnodes.literal_emphasis or sphinx.addnodes.literal_strong.

For the role content, you have the same syntactical possibilities as for standard Sphinx roles (see Crossreferencing syntax).

If override is True, the given object type is forcedly installed even if an object type having the same name is already installed.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_crossref_type(directivename: str^{541}, rolename: str^{542}, indextemplate: str^{543} = ", ref_nodeclass:
                                     type^{544}[TextElement] | None^{545} = None, objname: str^{546} = ", override: bool^{547} =
                                     False) \rightarrow None<sup>548</sup>
```

Register a new crossref object type.

This method is very similar to add_object_type() except that the directive it generates must be empty, and will produce no output.

That means that you can add semantic targets to your sources, and refer to them using custom roles instead of generic ones (like *ref*). Example call:

```
app.add_crossref_type('topic', 'topic', 'single: %s',
                      docutils.nodes.emphasis)
```

Example usage:

```
.. topic:: application API
The application API
```

⁵⁴⁰ https://docs.python.org/3/library/constants.html#None

(continued from previous page)

Some random text here.

See also :topic:`this section <application API>`.

(Of course, the element following the topic directive needn't be a section.)

Parameters

override – If false, do not install it if another cross-reference type is already installed as the same name If true, unconditionally install the cross-reference type.

Changed in version 1.8: Add override keyword.

Sphinx.add_transform(transform: $type^{549}[Transform]$) \rightarrow None⁵⁵⁰

Register a Docutils transform to be applied after parsing.

Add the standard docutils Transform subclass *transform* to the list of transforms that are applied after Sphinx parses a reST document.

Parameters

transform – A transform class

Table 1: priority range categories for Sphinx transforms

| Priority | Main purpose in Sphinx |
|----------|--|
| 0-99 | Fix invalid nodes by docutils. Translate a doctree. |
| 100-299 | Preparation |
| 300-399 | early |
| 400-699 | main |
| 700-799 | Post processing. Deadline to modify text and referencing. |
| 800-899 | Collect referencing and referenced nodes. Domain processing. |
| 900-999 | Finalize and clean up. |

refs: Transform Priority Range Categories⁵⁵¹

Sphinx.add_post_transform(transform: $type^{552}[Transform]$) \rightarrow None⁵⁵³

Register a Docutils transform to be applied before writing.

Add the standard docutils Transform subclass *transform* to the list of transforms that are applied before Sphinx writes a document.

Parameters

transform – A transform class

⁵⁴¹ https://docs.python.org/3/library/stdtypes.html#str

⁵⁴² https://docs.python.org/3/library/stdtypes.html#str

⁵⁴³ https://docs.python.org/3/library/stdtypes.html#str

⁵⁵² https://docs.python.org/3/library/functions.html#type

⁵⁵³ https://docs.python.org/3/library/constants.html#None

```
Sphinx.add_js_file(filename: str^{554} \mid None^{555}, priority: int^{556} = 500, loading_method: str^{557} \mid None^{558} = None, **kwargs: Any^{559}) \rightarrow None^{560}
```

Register a JavaScript file to include in the HTML output.

Parameters

- **filename** The name of a JavaScript file that the default HTML template will include. It must be relative to the HTML static path, or a full URI with scheme, or None . The None value is used to create an inline <script> tag. See the description of *kwargs* below.
- **priority** Files are included in ascending order of priority. If multiple JavaScript files have the same priority, those files will be included in order of registration. See list of "priority range for JavaScript files" below.
- **loading_method** The loading method for the JavaScript file. Either 'async' or 'defer' are allowed.
- **kwargs** Extra keyword arguments are included as attributes of the <script> tag. If the special keyword argument body is given, its value will be added as the content of the <script> tag.

Example:

```
app.add_js_file('example.js')
# => <script src="_static/example.js"></script>

app.add_js_file('example.js', loading_method="async")
# => <script src="_static/example.js" async="async"></script>

app.add_js_file(None, body="var myVariable = 'foo';")
# => <script>var myVariable = 'foo';</script>
```

Table 2: priority range for JavaScript files

| Priority | Main purpose in Sphinx |
|----------|--|
| 200 | default priority for built-in JavaScript files |
| 500 | default priority for extensions |
| 800 | default priority for html_js_files |

A JavaScript file can be added to the specific HTML page when an extension calls this method on html-page-context event.

New in version 0.5.

Changed in version 1.8: Renamed from app.add_javascript(). And it allows keyword arguments as attributes of script tag.

Changed in version 3.5: Take priority argument. Allow to add a JavaScript file to the specific page.

Changed in version 4.4: Take loading_method argument. Allow to change the loading method of the JavaScript file.

https://docs.python.org/3/library/stdtypes.html#str

⁵⁵⁵ https://docs.python.org/3/library/constants.html#None

⁵⁵⁶ https://docs.python.org/3/library/functions.html#int

⁵⁵⁷ https://docs.python.org/3/library/stdtypes.html#str

⁵⁵⁸ https://docs.python.org/3/library/constants.html#None

⁵⁵⁹ https://docs.python.org/3/library/typing.html#typing.Any

⁵⁶⁰ https://docs.python.org/3/library/constants.html#None

Sphinx.add_css_file(filename: str^{561} , priority: $int^{562} = 500$, **kwargs: Any^{563}) \rightarrow None⁵⁶⁴ Register a stylesheet to include in the HTML output.

Parameters

- **filename** The name of a CSS file that the default HTML template will include. It must be relative to the HTML static path, or a full URI with scheme.
- **priority** Files are included in ascending order of priority. If multiple CSS files have the same priority, those files will be included in order of registration. See list of "priority range for CSS files" below.
- **kwargs** Extra keyword arguments are included as attributes of the tag.

Example:

```
app.add_css_file('custom.css')
# => <link rel="stylesheet" href="_static/custom.css" type="text/css" />
app.add_css_file('print.css', media='print')
# => <link rel="stylesheet" href="_static/print.css"
# type="text/css" media="print" />
app.add_css_file('fancy.css', rel='alternate stylesheet', title='fancy')
# => <link rel="alternate stylesheet" href="_static/fancy.css"
# type="text/css" title="fancy" />
```

Table 3: priority range for CSS files

| Priority | Main purpose in Sphinx |
|----------|---|
| 200 | default priority for built-in CSS files |
| 500 | default priority for extensions |
| 800 | default priority for html_css_files |

A CSS file can be added to the specific HTML page when an extension calls this method on httml-page-context event.

New in version 1.0.

Changed in version 1.6: Optional alternate and/or title attributes can be supplied with the arguments *alternate* (a Boolean) and *title* (a string). The default is no title and *alternate* = False. For more information, refer to the documentation ⁵⁶⁵.

Changed in version 1.8: Renamed from app.add_stylesheet(). And it allows keyword arguments as attributes of link tag.

Changed in version 3.5: Take priority argument. Allow to add a CSS file to the specific page.

```
Sphinx.add_latex_package(packagename: str^{566}, options: str^{567} \mid None^{568} = None, after_hyperref: bool^{569} = False) \rightarrow None^{570}
```

Register a package to include in the LaTeX source code.

 $^{^{561}\} https://docs.python.org/3/library/stdtypes.html\#str$

⁵⁶² https://docs.python.org/3/library/functions.html#int

⁵⁶³ https://docs.python.org/3/library/typing.html#typing.Any

https://docs.python.org/3/library/constants.html#None

⁵⁶⁵ https://mdn.io/Web/CSS/Alternative_style_sheets

Add *packagename* to the list of packages that LaTeX source code will include. If you provide *options*, it will be taken to the *usepackage* declaration. If you set *after_hyperref* truthy, the package will be loaded after hyperref package.

```
app.add_latex_package('mypackage')
# => \usepackage{mypackage}
app.add_latex_package('mypackage', 'foo,bar')
# => \usepackage[foo,bar]{mypackage}
```

New in version 1.3.

New in version 3.1: after_hyperref option.

```
Sphinx.add_lexer(alias: str^{571}, lexer: type^{572}[Lexer]) \rightarrow None<sup>573</sup>
```

Register a new lexer for source code.

Use *lexer* to highlight code blocks with the given language *alias*.

New in version 0.6.

Changed in version 2.1: Take a lexer class as an argument.

Changed in version 4.0: Removed support for lexer instances as an argument.

```
Sphinx.add_autodocumenter(cls: Any^{574}, override: bool^{575} = False) \rightarrow None<sup>576</sup>
```

Register a new documenter class for the autodoc extension.

Add *cls* as a new documenter class for the *sphinx.ext.autodoc* extension. It must be a subclass of *sphinx.ext.autodoc*. Documenter. This allows auto-documenting new types of objects. See the source of the autodoc module for examples on how to subclass Documenter.

If *override* is True, the given *cls* is forcedly installed even if a documenter having the same name is already installed.

See Developing autodoc extension for IntEnum.

New in version 0.6.

Changed in version 2.2: Add override keyword.

```
Sphinx.add_autodoc_attrgetter(typ: type^{577}, getter: Callable^{578}[[Any^{579}, str^{580}, Any^{581}], Any^{582}]) \rightarrow None^{583}
Register a new getattr-like function for the autodoc extension.
```

Add *getter*, which must be a function with an interface compatible to the getattr() 584 builtin, as the autodoc attribute getter for objects that are instances of *typ*. All cases where autodoc needs to get an attribute of a type are then handled by this function instead of getattr() 585 .

New in version 0.6.

⁵⁶⁶ https://docs.python.org/3/library/stdtypes.html#str

⁵⁶⁷ https://docs.python.org/3/library/stdtypes.html#str

⁵⁶⁸ https://docs.python.org/3/library/constants.html#None

⁵⁶⁹ https://docs.python.org/3/library/functions.html#bool

⁵⁷⁰ https://docs.python.org/3/library/constants.html#None

⁵⁷¹ https://docs.python.org/3/library/stdtypes.html#str

⁵⁷² https://docs.python.org/3/library/functions.html#type

⁵⁷³ https://docs.python.org/3/library/constants.html#None

https://docs.python.org/3/library/typing.html#typing.Any

⁵⁷⁵ https://docs.python.org/3/library/functions.html#bool

https://docs.python.org/3/library/constants.html#None

```
Sphinx.add_search_language(cls: Any^{586}) \rightarrow None<sup>587</sup>
```

Register a new language for the HTML search index.

Add cls, which must be a subclass of sphinx.search.SearchLanguage, as a support language for building the HTML full-text search index. The class must have a lang attribute that indicates the language it should be used for. See httml_search_language.

New in version 1.1.

```
Sphinx.add_source_suffix(suffix: str^{588}, filetype: str^{589}, override: bool^{590} = False) \rightarrow None<sup>591</sup>
```

Register a suffix of source files.

Same as *source_suffix*. The users can override this using the config setting.

override – If false, do not install it the same suffix is already installed. If true, unconditionally install the suffix.

New in version 1.8.

```
Sphinx.add_source_parser(parser: type^{592}[Parser], override: bool^{593} = False) \rightarrow None<sup>594</sup>
```

Register a parser class.

Parameters

override – If false, do not install it if another parser is already installed for the same suffix. If true, unconditionally install the parser.

New in version 1.4.

Changed in version 1.8: *suffix* argument is deprecated. It only accepts parser argument. Use add_source_suffix() API to register suffix instead.

Changed in version 1.8: Add override keyword.

```
Sphinx.add_env_collector(collector: type^{595}[EnvironmentCollector]) \rightarrow None<sup>596</sup>
```

Register an environment collector class.

Refer to Environment Collector API.

New in version 1.6.

⁵⁹⁴ https://docs.python.org/3/library/constants.html#None

⁵⁹⁵ https://docs.python.org/3/library/functions.html#type

⁵⁹⁶ https://docs.python.org/3/library/constants.html#None

```
Sphinx.add_html_theme(name: str^{597}, theme path: str^{598}) \rightarrow None<sup>599</sup>
```

Register a HTML Theme.

The *name* is a name of theme, and *theme_path* is a full path to the theme (refs: *Distribute your theme as a Python package*).

New in version 1.6.

```
Sphinx.add_html_math_renderer(name: str^{600}, inline\_renderers: tuple^{601}[Callable^{602}, Callable^{603} \mid None^{604}] \mid None^{605} = None, block\_renderers: tuple^{606}[Callable^{607}, Callable^{608} \mid None^{609}] \mid None^{610} = None) \rightarrow None^{611}
```

Register a math renderer for HTML.

The *name* is a name of math renderer. Both *inline_renderers* and *block_renderers* are used as visitor functions for the HTML writer: the former for inline math node (nodes.math), the latter for block math node (nodes.math_block). Regarding visitor functions, see add_node() for details.

New in version 1.8.

```
Sphinx.add_message_catalog(catalog: str^{612}, locale\_dir: str^{613}) \rightarrow None<sup>614</sup>
```

Register a message catalog.

Parameters

- catalog The name of the catalog
- locale_dir The base path of the message catalog

For more details, see *sphinx.locale.get_translation()*.

New in version 1.8.

```
Sphinx.is_parallel_allowed(typ: str^{615}) \rightarrow bool^{616}
```

Check whether parallel processing is allowed or not.

Parameters

```
typ - A type of processing; 'read' or 'write'.
```

exception sphinx.application.ExtensionError

All these methods raise this exception if something went wrong with the extension API.

Emitting events

class sphinx.application.Sphinx

```
emit(event: str^{617}, *args: Any^{618}, allowed_exceptions: tuple^{619}[type^{620}[Exception^{621}], ...] = ()) \rightarrow list^{622}
Emit event and pass arguments to the callback functions.
```

Return the return values of all callbacks as a list. Do not emit core Sphinx events in extensions!

Parameters

- event The name of event that will be emitted
- args The arguments for the event
- allowed_exceptions The list of exceptions that are allowed in the callbacks

Changed in version 3.1: Added *allowed_exceptions* to specify path-through exceptions

emit_firstresult(event:
$$str^{623}$$
, *args: Any^{624} , allowed_exceptions: $tuple^{625}[type^{626}[Exception^{627}], ...] = ()) \rightarrow Any^{628}$

Emit *event* and pass *arguments* to the callback functions.

Return the result of the first callback that doesn't return None.

Parameters

- event The name of event that will be emitted
- args The arguments for the event
- allowed_exceptions The list of exceptions that are allowed in the callbacks

New in version 0.5.

Changed in version 3.1: Added *allowed_exceptions* to specify path-through exceptions

Sphinx runtime information

The application object also provides runtime information as attributes.

Sphinx.project

Target project. See Project.

Sphinx.srcdir

Source directory.

Sphinx.confdir

Directory containing conf.py.

 $^{^{628}\} https://docs.python.org/3/library/typing.html\#typing.Any$

Sphinx.doctreedir

Directory for storing pickled doctrees.

Sphinx.outdir

Directory for storing built document.

Sphinx core events

These events are known to the core. The arguments shown are given to the registered event handlers. Use *Sphinx*. *connect()* in an extension's setup function (note that conf.py can also have a setup function) to connect handlers to the events. Example:

```
def source_read_handler(app, docname, source):
    print('do something here...')

def setup(app):
    app.connect('source-read', source_read_handler)
```

Below is an overview of each event that happens during a build. In the list below, we include the event name, its callback parameters, and the input and output type for that event:

```
    event.config-inited(app,config)

2. event.builder-inited(app)
event.env-get-outdated(app, env, added, changed, removed)
4. event.env-before-read-docs(app, env, docnames)
for docname in docnames:
   5. event.env-purge-doc(app, env, docname)
   if doc changed and not removed:
      source-read(app, docname, source)
      7. run source parsers: text -> docutils.document
         - parsers can be added with the app.add_source_parser() API
      8. apply transforms based on priority: docutils.document -> docutils.document
         - event.doctree-read(app, doctree) is called in the middle of transforms,
           transforms come before/after this event depending on their priority.
9. event.env-merge-info(app, env, docnames, other)
   - if running in parallel mode, this event will be emitted for each process
10. event.env-updated(app, env)
11. event.env-get-updated(app, env)
12. event.env-check-consistency(app, env)
# The updated-docs list can be builder dependent, but generally includes all new/changed.
→documents,
# plus any output from `env-get-updated`, and then all "parent" documents in the ToC tree
# For builders that output a single page, they are first joined into a single doctree.
→before post-transforms
# or the doctree-resolved event is emitted
for docname in updated-docs:
   13. apply post-transforms (by priority): docutils.document -> docutils.document
   14. event.doctree-resolved(app, doctree, docname)
```

(continues on next page)

(continued from previous page)

- In the event that any reference nodes fail to resolve, the following may emit:
- event.missing-reference(env, node, contnode)
- event.warn-missing-reference(domain, node)
- 15. Generate output files
- 16. event.build-finished(app, exception)

Here is a more detailed list of these events.

builder-inited(app)

Emitted when the builder object has been created. It is available as app.builder.

config-inited(app, config)

Emitted when the config object has been initialized.

New in version 1.8.

env-get-outdated(app, env, added, changed, removed)

Emitted when the environment determines which source files have changed and should be re-read. *added*, *changed* and *removed* are sets of docnames that the environment has determined. You can return a list of docnames to re-read in addition to these.

New in version 1.1.

env-purge-doc(app, env, docname)

Emitted when all traces of a source file should be cleaned from the environment, that is, if the source file is removed or before it is freshly read. This is for extensions that keep their own caches in attributes of the environment.

For example, there is a cache of all modules on the environment. When a source file has been changed, the cache's entries for the file are cleared, since the module declarations could have been removed from the file.

New in version 0.5.

env-before-read-docs(app, env, docnames)

Emitted after the environment has determined the list of all added and changed files and just before it reads them. It allows extension authors to reorder the list of docnames (*inplace*) before processing, or add more docnames that Sphinx did not consider changed (but never add any docnames that are not in env.found_docs).

You can also remove document names; do this with caution since it will make Sphinx treat changed files as unchanged.

New in version 1.3.

source-read(app, docname, source)

Emitted when a source file has been read. The *source* argument is a list whose single element is the contents of the source file. You can process the contents and replace this item to implement source-level transformations.

For example, if you want to use \$ signs to delimit inline math, like in LaTeX, you can use a regular expression to replace \$...\$ by :math:`...`.

New in version 0.5.

include-read(app, relative_path, parent_docname, content)

Emitted when a file has been read with the include⁶²⁹ directive. The *relative_path* argument is a Path⁶³⁰ object representing the relative path of the included file from the *source directory*. The *parent_docname* argument is the name of the document that contains the include⁶³¹ directive. The *source* argument is a list whose single element is the contents of the included file. You can process the contents and replace this item to transform the included content, as with the *source-read* event.

New in version 7.2.5.

See also:

The include⁶³² directive and the *source-read* event.

object-description-transform(app, domain, objtype, contentnode)

Emitted when an object description directive has run. The *domain* and *objtype* arguments are strings indicating object description of the object. And *contentnode* is a content for the object. It can be modified in-place.

New in version 2.4.

doctree-read(app, doctree)

Emitted when a doctree has been parsed and read by the environment, and is about to be pickled. The *doctree* can be modified in-place.

missing-reference(app, env, node, contnode)

Emitted when a cross-reference to an object cannot be resolved. If the event handler can resolve the reference, it should return a new docutils node to be inserted in the document tree in place of the node *node*. Usually this node is a reference node containing *contnode* as a child. If the handler can not resolve the cross-reference, it can either return None to let other handlers try, or raise NoUri to prevent other handlers in trying and suppress a warning about this cross-reference being unresolved.

Parameters

- **env** The build environment (app.builder.env).
- **node** The *pending_xref* node to be resolved. Its reftype, reftarget, modname and classname attributes determine the type and target of the reference.
- **contnode** The node that carries the text and formatting inside the future reference and should be a child of the returned reference node.

New in version 0.5.

warn-missing-reference(app, domain, node)

Emitted when a cross-reference to an object cannot be resolved even after <code>missing-reference</code>. If the event handler can emit warnings for the missing reference, it should return <code>True</code>. The configuration variables <code>nitpick_ignore</code> and <code>nitpick_ignore_regex</code> prevent the event from being emitted for the corresponding nodes.

New in version 3.4.

doctree-resolved(app, doctree, docname)

Emitted when a doctree has been "resolved" by the environment, that is, all references have been resolved and TOCs have been inserted. The *doctree* can be modified in place.

Here is the place to replace custom nodes that don't have visitor methods in the writers, so that they don't cause errors when the writers encounter them.

env-merge-info(app, env, docnames, other)

This event is only emitted when parallel reading of documents is enabled. It is emitted once for every subprocess that has read some documents.

You must handle this event in an extension that stores data in the environment in a custom location. Otherwise the environment in the main process will not be aware of the information stored in the subprocess.

⁶²⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

 $^{^{630}\} https://docs.python.org/3/library/pathlib.html\#pathlib.Path$

⁶³¹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

⁶³² https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

other is the environment object from the subprocess, *env* is the environment from the main process. *docnames* is a set of document names that have been read in the subprocess.

New in version 1.3.

env-updated(app, env)

Emitted after reading all documents, when the environment and all doctrees are now up-to-date.

You can return an iterable of docnames from the handler. These documents will then be considered updated, and will be (re-)written during the writing phase.

New in version 0.5.

Changed in version 1.3: The handlers' return value is now used.

env-check-consistency(app, env)

Emitted when Consistency checks phase. You can check consistency of metadata for whole of documents.

New in version 1.6: As a **experimental** event

html-collect-pages(app)

Emitted when the HTML builder is starting to write non-document pages. You can add pages to write by returning an iterable from this event consisting of (pagename, context, templatename).

New in version 1.0.

html-page-context(app, pagename, templatename, context, doctree)

Emitted when the HTML builder has created a context dictionary to render a template with – this can be used to add custom elements to the context.

The *pagename* argument is the canonical name of the page being rendered, that is, without .html suffix and using slashes as path separators. The *templatename* is the name of the template to render, this will be 'page.html' for all pages from reST documents.

The *context* argument is a dictionary of values that are given to the template engine to render the page and can be modified to include custom values. Keys must be strings.

The *doctree* argument will be a doctree when the page is created from a reST documents; it will be None when the page is created from an HTML template alone.

You can return a string from the handler, it will then replace 'page.html' as the HTML template for this page.

Note: You can install JS/CSS files for the specific page via *Sphinx.add_js_file()* and *Sphinx.add_css_file()* since v3.5.0.

New in version 0.4.

Changed in version 1.3: The return value can now specify a template name.

linkcheck-process-uri(app, uri)

Emitted when the linkcheck builder collects hyperlinks from document. *uri* is a collected URI. The event handlers can modify the URI by returning a string.

New in version 4.1.

build-finished(app, exception)

Emitted when a build has finished, before Sphinx exits, usually used for cleanup. This event is emitted even when the build process raised an exception, given as the *exception* argument. The exception is reraised in the application after the event handlers have run. If the build process raised no exception, *exception* will be None. This allows to customize cleanup actions depending on the exception status.

New in version 0.5.

Checking the Sphinx version

Use this to adapt your extension to API changes in Sphinx.

```
sphinx.version_info = (7, 3, 0, 'beta', 0)
```

Version info for better programmatic use.

A tuple of five elements; for Sphinx version 1.2.1 beta 3 this would be (1, 2, 1, 'beta', 3). The fourth element can be one of: alpha, beta, rc, final. final always has 0 as the last element.

New in version 1.2: Before version 1.2, check the string sphinx.__version__.

The Config object

```
class sphinx.config.Config: dict^{633}[str^{634}, Any^{635}] \mid None^{636} = None, overrides: <math>dict^{637}[str^{638}, Any^{639}] \mid None^{640} = None)
```

Configuration file abstraction.

The Config object makes the values of all config options available as attributes.

It is exposed via the *Sphinx*.config and *sphinx*.environment.BuildEnvironment.config attributes. For example, to get the value of *language*, use either app.config.language or env.config.language.

The template bridge

class sphinx.application.TemplateBridge

This class defines the interface for a "template bridge", that is, a class that renders templates given a template name and a context.

init(builder: Builder, theme: Theme | None⁶⁴¹ = None, dirs: $list^{642}[str^{643}]$ | None⁶⁴⁴ = None) \rightarrow None⁶⁴⁵ Called by the builder to initialize the template system.

builder is the builder object; you'll probably want to look at the value of builder.config.templates_path.

theme is a sphinx.theming.Theme object or None; in the latter case, *dirs* can be list of fixed directories to look for templates.

newest_template_mtime() \rightarrow float⁶⁴⁶

Called by the builder to determine if output files are outdated because of template changes. Return the mtime of the newest template file that was changed. The default implementation returns 0.

render($template: str^{647}, context: dict^{648}$) \rightarrow None⁶⁴⁹

Called by the builder to render a template given as a filename with a specified context (a Python dictionary).

⁶³³ https://docs.python.org/3/library/stdtypes.html#dict

⁶³⁴ https://docs.python.org/3/library/stdtypes.html#str

⁶³⁵ https://docs.python.org/3/library/typing.html#typing.Any

⁶³⁶ https://docs.python.org/3/library/constants.html#None

⁶³⁷ https://docs.python.org/3/library/stdtypes.html#dict

⁶³⁸ https://docs.python.org/3/library/stdtypes.html#str

⁶³⁹ https://docs.python.org/3/library/typing.html#typing.Any

⁶⁴⁰ https://docs.python.org/3/library/constants.html#None

```
render_string(template: str^{650}, context: dict^{651}) \rightarrow str^{652}
```

Called by the builder to render a template given as a string with a specified context (a Python dictionary).

Exceptions

exception sphinx.errors.SphinxError

Base class for Sphinx errors.

This is the base class for "nice" exceptions. When such an exception is raised, Sphinx will abort the build and present the exception category and message to the user.

Extensions are encouraged to derive from this exception for their custom errors.

Exceptions *not* derived from *SphinxError* are treated as unexpected and shown to the user with a part of the traceback (and the full traceback saved in a temporary file).

category

Description of the exception "category", used in converting the exception to a string ("category: message"). Should be set accordingly in subclasses.

exception sphinx.errors.ConfigError

Configuration error.

```
exception sphinx.errors.ExtensionError(message: str^{653}, orig\_exc: Exception^{654} \mid None^{655} = None, modname: <math>str^{656} \mid None^{657} = None)
```

Extension error.

exception sphinx.errors.ThemeError

Theme error.

exception sphinx.errors.VersionRequirementError

Incompatible Sphinx version error.

Project API

```
class sphinx.project.Project(srcdir: str<sup>658</sup> | os.PathLike<sup>659</sup>[str<sup>660</sup>], source_suffix: Iterable[str<sup>661</sup>])
       A project is the source code set of the Sphinx document(s).
       \textbf{discover}(exclude\_paths: Iterable[str^{662}] = (), include\_paths: Iterable[str^{663}] = ('**',)) \rightarrow \text{set}^{664}[\text{str}^{665}]
             Find all document files in the source directory and put them in docnames.
       doc2path(docname: str^{666}, absolute: bool^{667}) \rightarrow str^{668}
             Return the filename for the document name.
             If absolute is True, return as an absolute path. Else, return as a relative path to the source directory.
       path2doc(filename: str^{669} \mid PathLike^{670} [str^{671}]) \rightarrow str^{672} \mid None^{673}
             Return the docname for the filename if the file is a document.
             filename should be absolute or relative to the source directory.
       restore(other: Project) \rightarrow None<sup>674</sup>
             Take over a result of last build.
       docnames: set^{675} [str^{676}]
             The name of documents belonging to this project.
       source_suffix
             source_suffix. Same as source_suffix.
       srcdir
             Source directory.
```

Build environment API

```
class sphinx.environment.BuildEnvironment
    Attributes
    app
        Reference to the Sphinx (application) object.
```

```
658 https://docs.python.org/3/library/stdtypes.html#str
659 https://docs.python.org/3/library/os.html#os.PathLike
660 https://docs.python.org/3/library/stdtypes.html#str
661 https://docs.python.org/3/library/stdtypes.html#str
662 https://docs.python.org/3/library/stdtypes.html#str
663 https://docs.python.org/3/library/stdtypes.html#str
664 https://docs.python.org/3/library/stdtypes.html#set
665 https://docs.python.org/3/library/stdtypes.html#str

674 https://docs.python.org/3/library/constants.html#None
675 https://docs.python.org/3/library/stdtypes.html#set
676 https://docs.python.org/3/library/stdtypes.html#str
```

config

Reference to the *Config* object.

project

Target project. See Project.

srcdir

Source directory.

doctreedir

Directory for storing pickled doctrees.

events

An EventManager object.

found_docs

A set of all existing docnames.

metadata

Dictionary mapping docnames to "metadata" (see *File-wide metadata*).

titles

Dictionary mapping docnames to the docutils node for their main title.

docname

Returns the documen of the document currently being parsed.

Utility methods

```
doc2path(docname: str^{677}, base: bool^{678} = True) \rightarrow str^{679}
```

Return the filename for the document name.

If base is True, return absolute path under self.srcdir. If base is False, return relative path to self.srcdir.

```
\textbf{relfn2path}(\textit{filename: str}^{680}, \textit{docname: str}^{681} \mid \textit{None}^{682} = \textit{None}) \rightarrow \text{tuple}^{683}[\text{str}^{684}, \text{str}^{685}]
```

Return paths to a file referenced from a document, relative to documentation root and absolute.

In the input "filename", absolute filenames are taken as relative to the source dir, while relative filenames are relative to the dir of the containing document.

```
note_dependency(filename: str^{686}) \rightarrow None<sup>687</sup>
```

Add filename as a dependency of the current document.

This means that the document will be rebuilt if this file changes.

filename should be absolute or relative to the source directory.

```
new_serialno(category: str^{688} = ") \rightarrow int^{689}
```

Return a serial number, e.g. for index entry targets.

The number is guaranteed to be unique in the current document.

```
\textbf{note\_reread()} \rightarrow None^{690}
```

Add the current document to the list of documents that will automatically be re-read at the next build.

Builder API

Todo: Expand this.

class sphinx.builders.Builder

This is the base class for all builders.

These attributes should be set on builder classes:

name = ''

The builder's name, for the -b command line option.

format = ''

The builder's output format, or "if no document output is produced.

epilog = ''

The message emitted upon successful build completion. This can be a printf-style template string with the following keys: outdir, project

allow_parallel = False

allow parallel write_doc() calls

```
supported_image_types: list<sup>691</sup>[str<sup>692</sup>] = []
```

The list of MIME types of image formats supported by the builder. Image files are searched in the order in which they appear here.

supported_remote_images = False

The builder supports remote images or not.

supported_data_uri_images = False

The builder supports data URIs or not.

```
default_translator_class: type<sup>693</sup>[nodes.NodeVisitor]
```

default translator class for the builder. This can be overridden by set_translator().

These methods are predefined and will be called from the application:

get_relative_uri(
$$from_{:}$$
: str^{694} , to: str^{695} , typ: $str^{696} \mid None^{697} = None$) $\rightarrow str^{698}$

Return a relative URI between two source filenames.

May raise environment. NoUri if there's no way to return a sensible URI.

```
build_all() \rightarrow None<sup>699</sup>
```

Build all source files.

⁶⁷⁷ https://docs.python.org/3/library/stdtypes.html#str

⁶⁷⁸ https://docs.python.org/3/library/functions.html#bool

⁶⁷⁹ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸⁰ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸¹ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸² https://docs.python.org/3/library/constants.html#None

⁶⁸³ https://docs.python.org/3/library/stdtypes.html#tuple

⁶⁸⁴ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸⁵ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸⁶ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸⁷ https://docs.python.org/3/library/constants.html#None

⁶⁸⁸ https://docs.python.org/3/library/stdtypes.html#str

⁶⁸⁹ https://docs.python.org/3/library/functions.html#int

⁶⁹⁰ https://docs.python.org/3/library/constants.html#None

```
build_specific(filenames: list^{700}[str^{701}]) \rightarrow None^{702}
```

Only rebuild as much as needed for changes in the filenames.

$$build_update() \rightarrow None^{703}$$

Only rebuild what was changed or added since last build.

```
build(docnames: Iterable[str<sup>704</sup>] | None<sup>705</sup>, summary: str^{706} | None<sup>707</sup> = None, method: str^{708} = 'update') \rightarrow None<sup>709</sup>
```

Main build method.

First updates the environment, and then calls write().

These methods can be overridden in concrete builder classes:

$$init() \rightarrow None^{710}$$

Load necessary templates and perform initialization. The default implementation does nothing.

$$get_outdated_docs() \rightarrow str^{711} | Iterable[str^{712}]$$

Return an iterable of output files that are outdated, or a string describing what an update build will build.

If the builder does not output individual files corresponding to source files, return a string here. If it does, return an iterable of those files that need to be written.

get_target_uri(docname:
$$str^{713}$$
, typ : $str^{714} \mid None^{715} = None$) $\rightarrow str^{716}$

Return the target URI for a document name.

typ can be used to qualify the link characteristic for individual builders.

prepare_writing(
$$docnames: set^{717}[str^{718}]$$
) \rightarrow None⁷¹⁹

A place where you can add logic before write_doc() is run

write_doc(docname:
$$str^{720}$$
, doctree: document) \rightarrow None⁷²¹

Where you actually write something to the filesystem.

finish()
$$\rightarrow$$
 None⁷²²

Finish the building process.

The default implementation does nothing.

Attributes

events

An EventManager object.

Environment Collector API

class sphinx.environment.collectors.EnvironmentCollector

An EnvironmentCollector is a specific data collector from each document.

It gathers data and stores *BuildEnvironment* as a database. Examples of specific data would be images, download files, section titles, metadatas, index entries and toctrees, etc.

```
clear_doc(app: Sphinx, env: BuildEnvironment, docname: str^{723}) \rightarrow None<sup>724</sup>
```

Remove specified data of a document.

This method is called on the removal of the document.

```
get_outdated_docs(app: Sphinx, env: BuildEnvironment, added: set^{725}[str^{726}], changed: set^{727}[str^{728}], removed: set^{729}[str^{730}]) \rightarrow list<sup>731</sup>[str<sup>732</sup>]
```

Return a list of docnames to re-read.

This methods is called before reading the documents.

```
get\_updated\_docs(app: Sphinx, env: BuildEnvironment) \rightarrow list^{733}[str^{734}]
```

Return a list of docnames to re-read.

This methods is called after reading the whole of documents (experimental).

```
merge_other(app: Sphinx, env: BuildEnvironment, docnames: set^{735}[str^{736}], other: BuildEnvironment) \rightarrow None<sup>737</sup>
```

Merge in specified data regarding docnames from a different *BuildEnvironment* object which coming from a subprocess in parallel builds.

https://docs.python.org/3/library/constants.html#None
```

```
process_doc(app: Sphinx, doctree: nodes.document) \rightarrow None<sup>738</sup>
```

Process a document and gather specific data from it.

This method is called after the document is read.

Docutils markup API

This section describes the API for adding ReST markup elements (roles and directives).

Roles

Directives

Directives are handled by classes derived from docutils.parsers.rst.Directive. They have to be registered by an extension using Sphinx.add_directive() or Sphinx.add_directive_to_domain().

class docutils.parsers.rst.Directive

The markup syntax of the new directive is determined by the follow five class attributes:

required_arguments = 0

Number of required directive arguments.

optional_arguments = 0

Number of optional arguments after the required arguments.

final_argument_whitespace = False

May the final argument contain whitespace?

option_spec = None

Mapping of option names to validator functions.

Option validator functions take a single parameter, the option argument (or None if not given), and should validate it or convert it to the proper form. They raise ValueError⁷³⁹ or TypeError⁷⁴⁰ to indicate failure.

There are several predefined and possibly useful validators in the docutils.parsers.rst.directives module.

has_content = False

May the directive have content?

New directives must implement the *run()* method:

⁷²³ https://docs.python.org/3/library/stdtypes.html#str

⁷²⁴ https://docs.python.org/3/library/constants.html#None

⁷²⁵ https://docs.python.org/3/library/stdtypes.html#set

⁷²⁶ https://docs.python.org/3/library/stdtypes.html#str

⁷²⁷ https://docs.python.org/3/library/stdtypes.html#set

⁷²⁸ https://docs.python.org/3/library/stdtypes.html#str

⁷²⁹ https://docs.python.org/3/library/stdtypes.html#set

⁷³⁰ https://docs.python.org/3/library/stdtypes.html#str

⁷³¹ https://docs.python.org/3/library/stdtypes.html#list

⁷³² https://docs.python.org/3/library/stdtypes.html#str

⁷³³ https://docs.python.org/3/library/stdtypes.html#list

https://docs.python.org/3/library/stdtypes.html#str

⁷³⁵ https://docs.python.org/3/library/stdtypes.html#set

⁷³⁶ https://docs.python.org/3/library/stdtypes.html#str

⁷³⁷ https://docs.python.org/3/library/constants.html#None

⁷³⁸ https://docs.python.org/3/library/constants.html#None

run()

This method must process the directive arguments, options and content, and return a list of Docutils/Sphinx nodes that will be inserted into the document tree at the point where the directive was encountered.

Instance attributes that are always set on the directive are:

name

The directive name (useful when registering the same directive class under multiple names).

arguments

The arguments given to the directive, as a list.

options

The options given to the directive, as a dictionary mapping option names to validated/converted values.

content

The directive content, if given, as a ViewList.

lineno

The absolute line number on which the directive appeared. This is not always a useful value; use srcline instead.

content_offset

Internal offset of the directive content. Used when calling nested_parse (see below).

block_text

The string containing the entire directive.

state

state_machine

The state and state machine which controls the parsing. Used for nested_parse.

ViewLists

Docutils represents document source lines in a class docutils.statemachine.ViewList. This is a list with extended functionality – for one, slicing creates views of the original list, and also the list contains information about the source line numbers.

The *Directive.content* attribute is a ViewList. If you generate content to be parsed as ReST, you have to create a ViewList yourself. Important for content generation are the following points:

- The constructor takes a list of strings (lines) and a source (document) name.
- The .append() method takes a line and a source name as well.

 $^{^{739}\} https://docs.python.org/3/library/exceptions.html \#ValueError$

⁷⁴⁰ https://docs.python.org/3/library/exceptions.html#TypeError

Parsing directive content as ReST

Many directives will contain more markup that must be parsed. To do this, use one of the following APIs from the *Directive.run()* method:

- self.state.nested_parse
- sphinx.util.nodes.nested_parse_with_titles() this allows titles in the parsed content.

Both APIs parse the content into a given node. They are used like this:

```
node = docutils.nodes.paragraph()
# either
nested_parse_with_titles(self.state, self.result, node)
# or
self.state.nested_parse(self.result, 0, node)
```

Note: sphinx.util.docutils.switch_source_input() allows to change a target file during nested_parse. It is useful to mixed contents. For example, sphinx. ext.autodoc uses it to parse docstrings:

```
from sphinx.util.docutils import switch_source_input

# Switch source_input between parsing content.

# Inside this context, all parsing errors and warnings are reported as

# happened in new source_input (in this case, ``self.result``).

with switch_source_input(self.state, self.result):
    node = docutils.nodes.paragraph()
    self.state.nested_parse(self.result, 0, node)
```

Deprecated since version 1.7: Until Sphinx 1.6, sphinx.ext.autodoc.AutodocReporter was used for this purpose. It is replaced by switch_source_input().

If you don't need the wrapping node, you can use any concrete node type and return node.children from the Directive.

See also:

Creating directives⁷⁴¹ HOWTO of the Docutils documentation

Domain API

class sphinx.domains.**Domain**(env: BuildEnvironment)

A Domain is meant to be a group of "object" description directives for objects of a similar nature, and corresponding roles to create references to them. Examples would be Python modules, classes, functions etc., elements of a templating language, Sphinx roles and directives, etc.

Each domain has a separate storage for information about existing objects and how to reference them in *self.data*, which must be a dictionary. It also must implement several functions that expose the object information in a uniform way to parts of Sphinx that allow the user to reference or search for objects in a domain-agnostic way.

About *self.data*: since all object and cross-referencing information is stored on a BuildEnvironment instance, the *domain.data* object is also stored in the *env.domaindata* dict under the key *domain.name*. Before the build process starts, every active domain is instantiated and given the environment object; the *domaindata* dict must then either be nonexistent or a dictionary whose 'version' key is equal to the domain class' *data_version* attribute. Otherwise, *OSError* is raised and the pickled environment is discarded.

⁷⁴¹ https://docutils.sourceforge.io/docs/howto/rst-directives.html

```
add_object_type(name: str^{742}, objtype: ObjType) \rightarrow None<sup>743</sup>
      Add an object type.
check_consistency() \rightarrow None<sup>744</sup>
      Do consistency checks (experimental).
clear_doc(docname: str^{745}) \rightarrow None<sup>746</sup>
      Remove traces of a document in the domain-specific inventories.
directive(name: str^{747}) \rightarrow Callable<sup>748</sup> | None<sup>749</sup>
      Return a directive adapter class that always gives the registered directive its full name ('domain:name') as
      self.name.
get_enumerable_node_type(node: Node) \rightarrow str^{750} \mid None^{751}
      Get type of enumerable nodes (experimental).
get_full_qualified_name(node: Element) \rightarrow str<sup>752</sup> | None<sup>753</sup>
      Return full qualified name for given node.
get\_objects() \rightarrow Iterable[tuple^{754}[str^{755}, str^{756}, str^{757}, str^{758}, str^{759}, int^{760}]]
      Return an iterable of "object descriptions".
      Object descriptions are tuples with six items:
      name
           Fully qualified name.
      dispname
           Name to display when searching/linking.
           Object type, a key in self.object_types.
      docname
           The document where it is to be found.
      anchor
           The anchor name for the object.
      priority
           How "important" the object is (determines placement in search results). One of:
           1
                Default priority (placed before full-text matches).
           0
                Object is important (placed before default-priority objects).
           2
                Object is unimportant (placed after full-text matches).
           -1
                Object should not show up in search at all.
get_type_name(type: ObjType, primary: bool^{761} = False) \rightarrow str^{762}
      Return full name for given ObjType.
merge_domaindata(docnames: list<sup>763</sup>[str<sup>764</sup>], otherdata: dict<sup>765</sup>[str<sup>766</sup>, Any<sup>767</sup>]) \rightarrow None<sup>768</sup>
      Merge in data regarding docnames from a different domaindata inventory (coming from a subprocess in
      parallel builds).
```

```
process_doc(env: BuildEnvironment, docname: str^{769}, document: nodes.document) \rightarrow None<sup>770</sup>
     Process a document after it is read by the environment.
process_field_xref(pnode: pending xref) \rightarrow None<sup>771</sup>
     Process a pending xref created in a doc field. For example, attach information about the current scope.
resolve_any_xref(env: BuildEnvironment, fromdocname: str<sup>772</sup>, builder: Builder, target: str<sup>773</sup>, node:
                       pending xref, contnode: Element) \rightarrow list<sup>774</sup>[tuple<sup>775</sup>[str<sup>776</sup>, Element]]
     Resolve the pending xref node with the given target.
     The reference comes from an "any" or similar role, which means that we don't know the type. Otherwise,
     the arguments are the same as for resolve_xref().
     The method must return a list (potentially empty) of tuples ('domain:role', newnode), where
      'domain:role' is the name of a role that could have created the same reference, e.g. 'py:func'.
     newnode is what resolve_xref() would return.
     New in version 1.3.
resolve_xref(env: BuildEnvironment, fromdocname: str<sup>777</sup>, builder: Builder, typ: str<sup>778</sup>, target: str<sup>779</sup>,
                  node: pending_xref, contnode: Element) \rightarrow Element | None<sup>780</sup>
     Resolve the pending_xref node with the given typ and target.
     This method should return a new node, to replace the xref node, containing the contnode which is the
     markup content of the cross-reference.
     If no resolution can be found, None can be returned; the xref node will then given to the
     missing-reference event, and if that yields no resolution, replaced by contnode.
     The method can also raise sphinx.environment.NoUri to suppress the missing-reference event
     being emitted.
role(name: str^{781}) \rightarrow RoleFunction | None<sup>782</sup>
     Return a role adapter function that always gives the registered role its full name ('domain:name') as the
     first argument.
setup() \rightarrow None^{783}
     Set up domain object.
dangling_warnings: dict^{784}[str^{785}, str^{786}] = \{\}
     role name -> a warning message if reference is missing
data: dict<sup>787</sup>
     data value
data_version = 0
     data version, bump this when the format of self.data changes
directives: dict<sup>788</sup>[str<sup>789</sup>, type<sup>790</sup>[Directive]] = {}
     directive name -> directive class
enumerable_nodes: dict<sup>791</sup>[type<sup>792</sup>[Node], tuple<sup>793</sup>[str<sup>794</sup>, TitleGetter | None<sup>795</sup>]] = {}
     node_class -> (enum_node_type, title_getter)
indices: list^{796}[type^{797}[Index]] = []
     a list of Index subclasses
```

initial_data: dict⁷⁹⁸ = {}

data value for a fresh environment

```
label = ''
    domain label: longer, more descriptive (used in messages)

name = ''
    domain name: should be short, but unique

object_types: dict<sup>799</sup>[str<sup>800</sup>, ObjType] = {}
    type (usually directive) name -> ObjType instance

roles: dict<sup>801</sup>[str<sup>802</sup>, RoleFunction | XRefRole] = {}
    role name -> role callable
```

class sphinx.domains.ObjType(lname: str⁸⁰³, *roles: Any⁸⁰⁴, **attrs: Any⁸⁰⁵)

An ObjType is the description for a type of object that a domain can document. In the object_types attribute of Domain subclasses, object type names are mapped to instances of this class.

801 https://docs.python.org/3/library/stdtypes.html#dict
802 https://docs.python.org/3/library/stdtypes.html#str
```

Constructor arguments:

- *lname*: localized name of the type (do not include domain name)
- roles: all the roles that can refer to an object of this type
- *attrs*: object attributes currently only "searchprio" is known, which defines the object's priority in the full-text search index, see *Domain.get_objects()*.

class sphinx.domains.Index(domain: Domain)

An Index is the description for a domain-specific index. To add an index to a domain, subclass Index, overriding the three name attributes:

- name is an identifier used for generating file names. It is also used for a hyperlink target for the index. Therefore, users can refer the index page using ref role and a string which is combined domain name and name attribute (ex. :ref:`py-modindex`).
- localname is the section title for the index.
- *shortname* is a short name for the index, for use in the relation bar in HTML output. Can be empty to disable entries in the relation bar.

and providing a *generate()* method. Then, add the index class to your domain's *indices* list. Extensions can add indices to existing domains using *add_index_to_domain()*.

Changed in version 3.0: Index pages can be referred by domain name and index name via ref role.

```
abstract generate(docnames: Iterable[str^{806}] \mid None^{807} = None) \rightarrow tuple^{808}[list^{809}[tuple^{810}[str^{811}, list^{812}[IndexEntry]]], bool^{813}]
```

Get entries for the index.

If docnames is given, restrict to entries referring to these docnames.

The return value is a tuple of (content, collapse):

collapse

A boolean that determines if sub-entries should start collapsed (for output formats that support collapsing sub-entries).

content:

A sequence of (letter, entries) tuples, where letter is the "heading" for the given entries, usually the starting letter, and entries is a sequence of single entries. Each entry is a sequence [name, subtype, docname, anchor, extra, qualifier, descr]. The items in this sequence have the following meaning:

name

The name of the index entry to be displayed.

subtype

The sub-entry related type. One of:

0

A normal entry.

1

An entry with sub-entries.

2

A sub-entry.

⁸⁰³ https://docs.python.org/3/library/stdtypes.html#str

⁸⁰⁴ https://docs.python.org/3/library/typing.html#typing.Any

⁸⁰⁵ https://docs.python.org/3/library/typing.html#typing.Any

docname

docname where the entry is located.

anchor

Anchor for the entry within docname

extra

Extra info for the entry.

qualifier

Qualifier for the description.

descr

Description for the entry.

Qualifier and description are not rendered for some output formats such as LaTeX.

Directive to describe a class, function or similar object. Not used directly, but subclassed (in domain-specific directives) to add custom behavior.

```
_object_hierarchy_parts(sig\_node: desc_signature) \rightarrow tuple<sup>814</sup>[str^{815}, ...]
```

Returns a tuple of strings, one entry for each part of the object's hierarchy (e.g. ('module', 'submodule', 'Class', 'method')). The returned tuple is used to properly nest children within parents in the table of contents, and can also be used within the _toc_entry_name() method.

This method must not be used outwith table of contents generation.

```
_toc_entry_name(sig\_node: desc_signature) \rightarrow str<sup>816</sup>
```

Returns the text of the table of contents entry for the object.

This function is called once, in run(), to set the name for the table of contents entry (a special attribute _toc_name is set on the object node, later used in environment.collectors.toctree. TocTreeCollector.process_doc().build_toc() when the table of contents entries are collected).

To support table of contents entries for their objects, domains must override this method, also respecting the configuration setting toc_object_entries_show_parents. Domains must also override _object_hierarchy_parts(), with one (string) entry for each part of the object's hierarchy. The result of this method is set on the signature node, and can be accessed as sig_node['_toc_parts'] for use within this method. The resulting tuple is also used to properly nest children within parents in the table of contents.

An example implementations of this method is within the python domain (PyObject. _toc_entry_name()). The python domain sets the _toc_parts attribute within the handle_signature() method.

add_target_and_index(name: ObjDescT, $sig: str^{817}$, $signode: desc_signature$) \rightarrow None⁸¹⁸

Add cross-reference IDs and entries to self.indexnode, if applicable.

name is whatever handle_signature() returned.

 $^{^{806}\} https://docs.python.org/3/library/stdtypes.html\#str$

⁸⁰⁷ https://docs.python.org/3/library/constants.html#None

⁸⁰⁸ https://docs.python.org/3/library/stdtypes.html#tuple

https://docs.python.org/3/library/stdtypes.html#list

⁸¹⁰ https://docs.python.org/3/library/stdtypes.html#tuple

⁸¹¹ https://docs.python.org/3/library/stdtypes.html#str

⁸¹² https://docs.python.org/3/library/stdtypes.html#list

⁸¹³ https://docs.python.org/3/library/functions.html#bool

```
after\_content() \rightarrow None^{819}
```

Called after parsing content. Used to reset information about the current directive context on the build environment.

```
before_content() \rightarrow None<sup>820</sup>
```

Called before parsing content. Used to set information about the current directive context on the build environment.

```
get\_signatures() \rightarrow list^{821}[str^{822}]
```

Retrieve the signatures to document from the directive arguments. By default, signatures are given as arguments, one per line.

```
handle_signature(sig: str<sup>823</sup>, signode: desc_signature) → ObjDescT
```

Parse the signature *sig* into individual nodes and append them to *signode*. If ValueError is raised, parsing is aborted and the whole *sig* is put into a single desc_name node.

The return value should be a value that identifies the object. It is passed to add_target_and_index() unchanged, and otherwise only used to skip duplicates.

```
run() \rightarrow list^{824}[Node]
```

Main directive entry function, called by docutils upon encountering the directive.

This directive is meant to be quite easily subclassable, so it delegates to several additional methods. What it does:

- find out if called as a domain-specific directive, set self.domain
- create a desc node to fit all description inside
- parse standard options, currently no-index
- · create an index node if needed as self.indexnode
- parse all given signatures (as returned by self.get_signatures()) using self.handle_signature(), which should either return a name or raise ValueError
- add index entries using self.add_target_and_index()
- parse the content and handle doc fields in it

```
transform_content(contentnode: desc content) \rightarrow None<sup>825</sup>
```

Called after creating the content through nested parsing, but before the object-description-transform event is emitted, and before the info-fields are transformed. Can be used to manipulate the content.

final_argument_whitespace = True

May the final argument contain whitespace?

```
has_content = True
```

May the directive have content?

```
option_spec: dict<sup>826</sup>[str<sup>827</sup>, Callable<sup>828</sup>[[str<sup>829</sup>], Any<sup>830</sup>]] = {'no-contents-entry': <function flag>, 'no-index': <function flag>, 'no-index-entry': <function flag>, 'noindex': <function flag>, 'noindex': <function flag>, 'noindexentry': <function flag>}
```

Mapping of option names to validator functions.

```
optional_arguments = 0
```

Number of optional arguments after the required arguments.

required_arguments = 1

Number of required directive arguments.

Python Domain

```
class sphinx.domains.python.PythonDomain(env: BuildEnvironment)
              Python language domain.
              objects
              modules
             note\_object(name: str^{831}, objtype: str^{832}, node\_id: str^{833}, aliased: bool^{834} = False, location: Anv^{835} = False, location 
                                                  None) \rightarrow None<sup>836</sup>
                          Note a python object for cross reference.
                          New in version 2.1.
              note\_module(name: str^{837}, node\_id: str^{838}, synopsis: str^{839}, platform: str^{840}, deprecated: bool^{841}) \rightarrow

Parser API

The docutils documentation describes⁸⁴³ parsers as follows:

The Parser analyzes the input document and creates a node tree representation.

In Sphinx, the parser modules works as same as docutils. The parsers are registered to Sphinx by extensions using Application APIs; *Sphinx.add_source_suffix()* and *Sphinx.add_source_parser()*.

The *source suffix* is a mapping from file suffix to file type. For example, .rst file is mapped to 'restructuredtext' type. Sphinx uses the file type to looking for parsers from registered list. On searching, Sphinx refers to the Parser. supported attribute and picks up a parser which contains the file type in the attribute.

The users can override the source suffix mappings using *source_suffix* like following:

```
# a mapping from file suffix to file types
source_suffix = {
    '.rst': 'restructuredtext',
    '.md': 'markdown',
}
```

You should indicate file types your parser supports. This will allow users to configure their settings appropriately.

class sphinx.parsers.Parser

A base class of source parsers. The additional parsers should inherit this class instead of docutils.parsers. Parser. Compared with docutils.parsers.Parser, this class improves accessibility to Sphinx APIs.

The subclasses can access sphinx core runtime objects (app, config and env).

```
set_application(app: Sphinx) \rightarrow None^{844}
```

set_application will be called from Sphinx to set app and other instance variables

Parameters

```
app (sphinx.application.Sphinx) - Sphinx application object
```

config: Config

The config object

env: BuildEnvironment

The environment object

Doctree node classes added by Sphinx

Nodes for domain-specific object descriptions

Top-level nodes

These nodes form the top-most levels of object descriptions.

```
class sphinx.addnodes.desc(rawsource=", *children, **attributes)
```

Node for a list of object signatures and a common description of them.

Contains one or more desc_signature nodes and then a single desc_content node.

This node always has two classes:

⁸⁴³ https://docutils.sourceforge.io/docs/dev/hacking.html#parsing-the-document

https://docs.python.org/3/library/constants.html#None

- The name of the domain it belongs to, e.g., py or cpp.
- The name of the object type in the domain, e.g., function.

```
class sphinx.addnodes.desc_signature(*args: Any<sup>845</sup>, **kwargs: Any<sup>846</sup>)
```

Node for a single object signature.

As default the signature is a single-line signature. Set is_multiline = True to describe a multi-line signature. In that case all child nodes must be desc_signature_line nodes.

This node always has the classes sig, sig-object, and the domain it belongs to.

```
class sphinx.addnodes.desc_signature_line(rawsource=", text=", *children, **attributes)
```

Node for a line in a multi-line object signature.

It should only be used as a child of a *desc_signature* with is_multiline set to True. Set add_permalink = True for the line that should get the permalink.

```
class sphinx.addnodes.desc_content(rawsource=", *children, **attributes)
```

Node for object description content.

Must be the last child node in a desc node.

```
class sphinx.addnodes.desc_inline(domain: str<sup>847</sup>, *args: Any<sup>848</sup>, **kwargs: Any<sup>849</sup>)
```

Node for a signature fragment in inline text.

This is for example used for roles like *cpp:expr*.

This node always has the classes sig, sig-inline, and the name of the domain it belongs to.

Nodes for high-level structure in signatures

These nodes occur in in non-multiline desc_signature nodes and in desc_signature_line nodes.

```
class sphinx.addnodes.desc_name(*args: Any<sup>850</sup>, **kwargs: Any<sup>851</sup>)
```

Node for the main object name.

For example, in the declaration of a Python class MyModule.MyClass, the main name is MyClass.

This node always has the class sig-name.

```
class sphinx.addnodes.desc_addname(*args: Any<sup>852</sup>, **kwargs: Any<sup>853</sup>)
```

Node for additional name parts for an object.

 $For example, in the declaration of a Python class \verb|MyModule.MyClass|, the additional name part is additional name part is additional$

This node always has the class sig-prename.

```
class sphinx.addnodes.desc_type(rawsource=", text=", *children, **attributes)
```

Node for return types or object type names.

⁸⁴⁵ https://docs.python.org/3/library/typing.html#typing.Any

⁸⁴⁶ https://docs.python.org/3/library/typing.html#typing.Any

⁸⁴⁷ https://docs.python.org/3/library/stdtypes.html#str

⁸⁵¹ https://docs.python.org/3/library/typing.html#typing.Any

⁸⁵² https://docs.python.org/3/library/typing.html#typing.Any

⁸⁵³ https://docs.python.org/3/library/typing.html#typing.Any

```
class sphinx.addnodes.desc_returns(rawsource=", text=", *children, **attributes)

Node for a "returns" annotation (a la -> in Python).
```

class sphinx.addnodes.desc_parameterlist(rawsource=", text=", *children, **attributes)

Node for a general parameter list.

As default the parameter list is written in line with the rest of the signature. Set multi_line_parameter_list = True to describe a multi-line parameter list. In that case each parameter will then be written on its own, indented line.

 $\textbf{class} \ \ \textbf{sphinx.addnodes.desc_parameter} (\textit{rawsource}='', \textit{text}='', \textit{*children}, \textit{**attributes})$

Node for a single parameter.

class sphinx.addnodes.desc_optional(rawsource=", text=", *children, **attributes)

Node for marking optional parts of the parameter list.

class sphinx.addnodes.desc_annotation(rawsource=", text=", *children, **attributes)

Node for signature annotations (not Python 3-style annotations).

Nodes for signature text elements

These nodes inherit *desc_sig_element* and are generally translated to docutils.nodes.inline by SigElementFallbackTransform.

Extensions may create additional desc_sig_*-like nodes but in order for SigElementFallbackTransform to translate them to inline nodes automatically, they must be added to SIG_ELEMENTS via the class keyword argument _sig_element=True of desc_sig_element, e.g.:

```
class desc_custom_sig_node(desc_sig_element, _sig_element=True): ...
```

For backwards compatibility, it is still possible to add the nodes directly using SIG_ELEMENTS. add(desc_custom_sig_node).

```
sphinx.addnodes.SIG_ELEMENTS: set<sup>854</sup>[type<sup>855</sup>[desc_sig_element]]
```

A set of classes inheriting *desc_sig_element*. Each node class is expected to be handled by the builder's translator class if the latter does not inherit from SphinxTranslator.

This set can be extended manually by third-party extensions or by subclassing *desc_sig_element* and using the class keyword argument *_sig_element=True*.

```
class sphinx.addnodes.desc_sig_element(rawsource: str^{856} = ", text: str^{857} = ", *children: Element, **attributes: Any)
```

Common parent class of nodes for inline text of a signature.

```
class sphinx.addnodes.desc_sig_space(rawsource: str^{858} = ", text: str^{859} = ", *children: Element, **attributes: Any)
```

Node for a space in a signature.

class sphinx.addnodes.**desc_sig_name**(*rawsource*: $str^{860} = "$, text: $str^{861} = "$, *children: Element, **attributes: Any)

Node for an identifier in a signature.

⁸⁵⁴ https://docs.python.org/3/library/stdtypes.html#set

⁸⁵⁵ https://docs.python.org/3/library/functions.html#type

⁸⁵⁶ https://docs.python.org/3/library/stdtypes.html#str

⁸⁵⁸ https://docs.python.org/3/library/stdtypes.html#str

⁸⁵⁹ https://docs.python.org/3/library/stdtypes.html#str

```
class sphinx.addnodes.desc_sig_operator(rawsource: str<sup>862</sup> = ", text: str<sup>863</sup> = ", *children: Element,
                                                         **attributes: Anv)
```

Node for an operator in a signature.

```
class sphinx.addnodes.desc_sig_punctuation(rawsource: str^{864} = ", text: str^{865} = ", *children: Element,
                                                      **attributes: Any)
```

Node for punctuation in a signature.

```
class sphinx.addnodes.desc_sig_keyword(rawsource: str<sup>866</sup> = ", text: str<sup>867</sup> = ", *children: Element,
                                                       **attributes: Any)
```

Node for a general keyword in a signature.

```
class sphinx.addnodes.desc_sig_keyword_type(rawsource: str<sup>868</sup> = ", text: str<sup>869</sup> = ", *children: Element,
                                                              **attributes: Any)
```

Node for a keyword which is a built-in type in a signature.

```
class sphinx.addnodes.desc_sig_literal_number(rawsource: str^{870} = ", text: str^{871} = ", *children:
                                                         Element, **attributes: Any)
```

Node for a numeric literal in a signature.

```
class sphinx.addnodes.desc_sig_literal_string(rawsource: str<sup>872</sup> = ", text: str<sup>873</sup> = ", *children:
                                                                Element, **attributes: Any)
```

Node for a string literal in a signature.

```
class sphinx.addnodes.desc_sig_literal_char(rawsource: str^{874} = ", text: str^{875} = ", *children: Element,
                                                       **attributes: Any)
```

Node for a character literal in a signature.

New admonition-like constructs

```
class sphinx.addnodes.versionmodified(rawsource=", text=", *children, **attributes)
```

Node for version change entries.

Currently used for "versionadded", "versionchanged", "deprecated" and "versionremoved" directives.

class sphinx.addnodes.seealso(rawsource=", *children, **attributes)

Custom "see also" admonition.

```
^{860}\ https://docs.python.org/3/library/stdtypes.html\#str

⁸⁷⁴ https://docs.python.org/3/library/stdtypes.html#str

⁸⁷⁵ https://docs.python.org/3/library/stdtypes.html#str

Other paragraph-level nodes

```
class sphinx.addnodes.compact_paragraph(rawsource=", text=", *children, **attributes)
```

Node for a compact paragraph (which never makes a node).

New inline nodes

```
class sphinx.addnodes.index(rawsource=", text=", *children, **attributes)
```

Node for index entries.

This node is created by the index directive and has one attribute, entries. Its value is a list of 5-tuples of (entrytype, entryname, target, ignored, key).

```
entrytype is one of "single", "pair", "double", "triple".
```

key is categorization characters (usually a single character) for general index page. For the details of this, please see also: *glossary* and issue #2320.

```
class sphinx.addnodes.pending_xref(rawsource="', *children, **attributes)
```

Node for cross-references that cannot be resolved without complete information about all documents.

These nodes are resolved before writing output, in BuildEnvironment.resolve_references.

```
class sphinx.addnodes.pending_xref_condition(rawsource=", text=", *children, **attributes)
```

Node representing a potential way to create a cross-reference and the condition in which this way should be used.

This node is only allowed to be placed under a *pending_xref* node. A **pending_xref** node must contain either no **pending_xref_condition** nodes or it must only contains **pending_xref_condition** nodes.

The cross-reference resolver will replace a *pending_xref* which contains **pending_xref_condition** nodes by the content of exactly one of those **pending_xref_condition** nodes' content. It uses the **condition** attribute to decide which **pending_xref_condition** node's content to use. For example, let us consider how the cross-reference resolver acts on:

If the cross-reference resolver successfully resolves the cross-reference, then it rewrites the **pending_xref** as:

```
<reference>
     teral>
          StringIO
```

Otherwise, if the cross-reference resolution failed, it rewrites the **pending_xref** as:

```
<reference>
     teral>
        io.StringIO
```

The **pending_xref_condition** node should have **condition** attribute. Domains can be store their individual conditions into the attribute to filter contents on resolving phase. As a reserved condition name,

condition="*" is used for the fallback of resolution failure. Additionally, as a recommended condition name, condition="resolved" represents a resolution success in the intersphinx module.

New in version 4.0.

```
class sphinx.addnodes.literal_emphasis(rawsource=", text=", *children, **attributes)
```

Node that behaves like *emphasis*, but further text processors are not applied (e.g. smartypants for HTML output).

class sphinx.addnodes.download_reference(rawsource=", text=", *children, **attributes)

Node for download references, similar to pending xref.

Special nodes

```
class sphinx.addnodes.only(rawsource=", *children, **attributes)
```

Node for "only" directives (conditional inclusion based on tags).

```
class sphinx.addnodes.highlightlang(rawsource=", *children, **attributes)
```

Inserted to set the highlight language and line number options for subsequent code blocks.

You should not need to generate the nodes below in extensions.

```
class sphinx.addnodes.glossary(rawsource=", *children, **attributes)
```

Node to insert a glossary.

```
class sphinx.addnodes.toctree(rawsource=", *children, **attributes)
```

Node for inserting a "TOC tree".

class sphinx.addnodes.start_of_file(rawsource=", *children, **attributes)

Node to mark start of a new file, used in the LaTeX builder only.

class sphinx.addnodes.productionlist(rawsource=", *children, **attributes)

Node for grammar production lists.

Contains production nodes.

class sphinx.addnodes.production(rawsource=", text=", *children, **attributes)

Node for a single grammar production rule.

Logging API

```
sphinx.util.logging.getLogger(name)
```

Get logger wrapped by sphinx.util.logging.SphinxLoggerAdapter.

Sphinx logger always uses sphinx.* namespace to be independent from settings of root logger. It ensures logging is consistent even if a third-party extension or imported application resets logger settings.

Example usage:

```
>>> from sphinx.util import logging
>>> logger = logging.getLogger(__name__)
>>> logger.info('Hello, this is an extension!')
Hello, this is an extension!
```

class sphinx.util.logging.SphinxLoggerAdapter(logging.LoggerAdapter)

LoggerAdapter allowing type and subtype keywords.

```
error(msg, *args, **kwargs)
critical(msg, *args, **kwargs)
warning(msg, *args, **kwargs)
```

Logs a message on this logger with the specified level. Basically, the arguments are as with python's logging module.

In addition, Sphinx logger supports following keyword arguments:

type, *subtype*

Categories of warning logs. It is used to suppress warnings by suppress_warnings setting.

location

Where the warning happened. It is used to include the path and line number in each log. It allows docname, tuple of docname and line number and nodes:

```
logger = sphinx.util.logging.getLogger(__name__)
logger.warning('Warning happened!', location='index')
logger.warning('Warning happened!', location=('chapter1/index', 10))
logger.warning('Warning happened!', location=some_node)
```

color

The color of logs. By default, error level logs are colored as "darkred", critical level ones is not colored, and warning level ones are colored as "red".

```
log(level, msg, *args, **kwargs)
info(msg, *args, **kwargs)
verbose(msg, *args, **kwargs)
debug(msg, *args, **kwargs)
```

Logs a message to this logger with the specified level. Basically, the arguments are as with python's logging module.

In addition, Sphinx logger supports following keyword arguments:

nonl

If true, the logger does not fold lines at the end of the log message. The default is False.

location

Where the message emitted. For more detail, see *SphinxLoggerAdapter.warning()*.

color

The color of logs. By default, info and verbose level logs are not colored, and debug level ones are colored as "darkgray".

sphinx.util.logging.pending_logging()

Context manager to postpone logging all logs temporarily.

For example:

```
>>> with pending_logging():
>>> logger.warning('Warning message!') # not flushed yet
>>> some_long_process()
>>>
Warning message! # the warning is flushed here
```

```
sphinx.util.logging.pending_warnings()
```

Context manager to postpone logging warnings temporarily.

```
Similar to pending_logging().
```

```
sphinx.util.logging.prefixed_warnings()
```

Context manager to prepend prefix to all warning log records temporarily.

For example:

```
>>> with prefixed_warnings("prefix:"):
>>> logger.warning('Warning message!') # => prefix: Warning message!
```

New in version 2.0.

i18n API

```
sphinx.locale.init(locale_dirs: Iterable[str<sup>876</sup> | None<sup>877</sup>], language: str<sup>878</sup> | None<sup>879</sup>, catalog: str<sup>880</sup> = 'sphinx', namespace: str<sup>881</sup> = 'general') \rightarrow tuple<sup>882</sup>[NullTranslations, bool<sup>883</sup>]
```

Look for message catalogs in *locale_dirs* and *ensure* that there is at least a NullTranslations catalog set in *translators*. If called multiple times or if several .mo files are found, their contents are merged together (thus making init reentrant).

```
sphinx.locale.init_console(locale\_dir: str^{884} \mid None^{885} = None, catalog: str^{886} = 'sphinx') \rightarrow tuple^{887}[NullTranslations^{888}, bool^{889}]
```

Initialize locale for console.

New in version 1.8.

```
sphinx.locale.get_translation(catalog: str^{890}, namespace: str^{891} = 'general') \rightarrow Callable[[str^{892}], str^{893}] Get a translation function based on the catalog and namespace.
```

The extension can use this API to translate the messages on the extension:

```
import os
from sphinx.locale import get_translation

MESSAGE_CATALOG_NAME = 'myextension' # name of *.pot, *.po and *.mo files
_ = get_translation(MESSAGE_CATALOG_NAME)
text = _('Hello Sphinx!')

def setup(app):
```

 $^{^{889}\} https://docs.python.org/3/library/functions.html\#bool$

(continued from previous page)

```
package_dir = os.path.abspath(os.path.dirname(__file__))
locale_dir = os.path.join(package_dir, 'locales')
app.add_message_catalog(MESSAGE_CATALOG_NAME, locale_dir)
```

With this code, sphinx searches a message catalog from \${package_dir}/locales/\${language}/LC_MESSAGES/myextension.mo. The language is used for the searching.

New in version 1.8.

```
sphinx.locale._(message: str^{894}) \rightarrow str^{895}
```

Translation function for messages on documentation (menu, labels, themes and so on). This function follows *language* setting.

```
sphinx.locale.__(message: str^{896}) \rightarrow str^{897}
```

Translation function for console messages This function follows locale setting (*LC_ALL*, *LC_MESSAGES* and so on).

Extension internationalization (i18n) and localization (I10n) using i18n API

New in version 1.8.

An extension may naturally come with message translations. This is briefly summarized in *sphinx.locale.get_translation()* help.

In practice, you have to:

- 1. Choose a name for your message catalog, which must be unique. Usually the name of your extension is used for the name of message catalog.
- 2. Mark in your extension sources all messages as translatable, via *sphinx.locale.get_translation()* function, usually renamed _(), e.g.:

3. Set up your extension to be aware of its dedicated translations:

⁸⁹⁰ https://docs.python.org/3/library/stdtypes.html#str

⁸⁹¹ https://docs.python.org/3/library/stdtypes.html#str

https://docs.python.org/3/library/stdtypes.html#str

https://docs.python.org/3/library/stdtypes.html#str

⁸⁹⁴ https://docs.python.org/3/library/stdtypes.html#str

⁸⁹⁵ https://docs.python.org/3/library/stdtypes.html#str

⁸⁹⁶ https://docs.python.org/3/library/stdtypes.html#str

⁸⁹⁷ https://docs.python.org/3/library/stdtypes.html#str

(continued from previous page)

```
locale_dir = os.path.join(package_dir, 'locales')
app.add_message_catalog(MESSAGE_CATALOG_NAME, locale_dir)
```

4. Generate message catalog template *.pot file, usually in locale/ source directory, for example via Babel⁸⁹⁸:

```
$ pybabel extract --output=src/locale/myextension.pot src/
```

5. Create message catalogs (*.po) for each language which your extension will provide localization, for example via Babel⁸⁹⁹:

- 6. Translate message catalogs for each language manually
- 7. Compile message catalogs into *.mo files, for example via Babel⁹⁰⁰:

```
$ pybabel compile --directory=src/locale --domain=myextension
```

8. Ensure that message catalog files are distributed when your package will be installed, by adding equivalent line in your extension MANIFEST.in:

Listing 3: MANIFEST.in

```
recursive-include src *.pot *.po *.mo
```

When the messages on your extension has been changed, you need to also update message catalog template and message catalogs, for example via Babel⁹⁰¹:

Utilities

Sphinx provides utility classes and functions to develop extensions.

Base classes for components

These base classes are useful to allow your extensions to obtain Sphinx components (e.g. *Config*, *BuildEnvironment* and so on) easily.

Note: The subclasses of them might not work with bare docutils because they are strongly coupled with Sphinx.

class sphinx.transforms.**SphinxTransform**(document, startnode=None)

A base class of Transforms.

Compared with docutils.transforms.Transform, this class improves accessibility to Sphinx APIs.

```
898 https://babel.pocoo.org/
```

⁸⁹⁹ https://babel.pocoo.org/

⁹⁰⁰ https://babel.pocoo.org/

⁹⁰¹ https://babel.pocoo.org/

property app: Sphinx

Reference to the Sphinx object.

property config: Config

Reference to the *Config* object.

property env: BuildEnvironment

Reference to the BuildEnvironment object.

class sphinx.transforms.post_transforms.**SphinxPostTransform**(document, startnode=None)

A base class of post-transforms.

Post transforms are invoked to modify the document to restructure it for outputting. They resolve references, convert images, do special transformation for each output formats and so on. This class helps to implement these post transforms.

apply(** $kwargs: Any^{902}$) \rightarrow None⁹⁰³

Override to apply the transform to the document tree.

 $is_supported() \rightarrow bool^{904}$

Check this transform working for current builder.

 $run(**kwargs: Any^{905}) \rightarrow None^{906}$

Main method of post transforms.

Subclasses should override this method instead of apply().

A base class for Sphinx directives.

This class provides helper methods for Sphinx directives.

Note: The subclasses of this class might not work with docutils. This class is strongly coupled with Sphinx.

get_location() \rightarrow str⁹⁰⁷

Get current location info for logging.

 $\texttt{get_source_info()} \rightarrow \mathsf{tuple}^{908}[\mathsf{str}^{909}, \mathsf{int}^{910}]$

Get source and line number.

 $set_source_info(node: Node) \rightarrow None^{911}$

Set source and line number to the node.

property config: Config

Reference to the *Config* object.

property env: BuildEnvironment

Reference to the BuildEnvironment object.

⁹⁰² https://docs.python.org/3/library/typing.html#typing.Any

⁹⁰³ https://docs.python.org/3/library/constants.html#None

⁹⁰⁴ https://docs.python.org/3/library/functions.html#bool

⁹⁰⁵ https://docs.python.org/3/library/typing.html#typing.Any

⁹⁰⁶ https://docs.python.org/3/library/constants.html#None

class sphinx.util.docutils.SphinxRole

A base class for Sphinx roles.

This class provides helper methods for Sphinx roles.

Note: The subclasses of this class might not work with docutils. This class is strongly coupled with Sphinx.

```
get_location() \rightarrow str^{912}
```

Get current location info for logging.

property config: Config

Reference to the *Config* object.

content: Sequence⁹¹³[str⁹¹⁴]

A list of strings, the directive content for customisation (from the "role" directive).

property env: BuildEnvironment

Reference to the BuildEnvironment object.

inliner: Inliner

The docutils.parsers.rst.states.Inliner object.

lineno: int⁹¹⁵

The line number where the interpreted text begins.

name: str^{916}

The role name actually used in the document.

```
options: dict^{917}[str^{918}, Any^{919}]
```

A dictionary of directive options for customisation (from the "role" directive).

rawtext: str⁹²⁰

A string containing the entire interpreted text input.

text: str^{921}

The interpreted text content.

class sphinx.util.docutils.ReferenceRole

A base class for reference roles.

The reference roles can accept link title <target> style as a text for the role. The parsed result; link title and target will be stored to self.title and self.target.

⁹⁰⁷ https://docs.python.org/3/library/stdtypes.html#str

⁹¹⁴ https://docs.python.org/3/library/stdtypes.html#str

⁹¹⁵ https://docs.python.org/3/library/functions.html#int

⁹¹⁶ https://docs.python.org/3/library/stdtypes.html#str

⁹¹⁷ https://docs.python.org/3/library/stdtypes.html#dict

⁹¹⁸ https://docs.python.org/3/library/stdtypes.html#str

⁹¹⁹ https://docs.python.org/3/library/typing.html#typing.Any

⁹²⁰ https://docs.python.org/3/library/stdtypes.html#str

⁹²¹ https://docs.python.org/3/library/stdtypes.html#str

disabled: bool 922

A boolean indicates the reference is disabled.

has_explicit_title: bool 923

A boolean indicates the role has explicit title or not.

target: str⁹²⁴

The link target for the interpreted text.

title: str⁹²⁵

The link title for the interpreted text.

class sphinx.transforms.post_transforms.images.ImageConverter(*args: Any⁹²⁶, **kwargs: Any⁹²⁷)

A base class for image converters.

An image converter is kind of Docutils transform module. It is used to convert image files which are not supported by a builder to the appropriate format for that builder.

For example, *LaTeX builder* supports PDF, PNG and JPEG as image formats. However it does not support SVG images. For such case, using image converters allows to embed these unsupported images into the document. One of the image converters; *sphinx.ext.imgconverter* can convert a SVG image to PNG format using Imagemagick internally.

There are three steps to make your custom image converter:

- 1. Make a subclass of ImageConverter class
- 2. Override conversion_rules, is_available() and convert()
- 3. Register your image converter to Sphinx using Sphinx.add_post_transform()

```
convert(\_from: str^{928}, \_to: str^{929}) \rightarrow bool^{930}
```

Convert an image file to the expected format.

_from is a path of the source image file, and _to is a path of the destination file.

```
is_available() \rightarrow bool^{931}
```

Return the image converter is available or not.

```
available: bool^{932} | None<sup>933</sup> = None
```

The converter is available or not. Will be filled at the first call of the build. The result is shared in the same process.

Todo: This should be refactored not to store the state without class variable.

```
conversion_rules: list^{934}[tuple^{935}[str^{936}, str^{937}]] = []
```

A conversion rules the image converter supports. It is represented as a list of pair of source image format (mimetype) and destination one:

```
conversion_rules = [
    ('image/svg+xml', 'image/png'),
    ('image/gif', 'image/png'),
    ('application/pdf', 'image/png'),
]
```

⁹²² https://docs.python.org/3/library/functions.html#bool

⁹²³ https://docs.python.org/3/library/functions.html#bool

⁹²⁴ https://docs.python.org/3/library/stdtypes.html#str

⁹²⁵ https://docs.python.org/3/library/stdtypes.html#str

```
default_priority = 200
```

Numerical priority of this transform, 0 through 999 (override).

Utility components

```
class sphinx.events.EventManager(app: Sphinx)

Event manager for Sphinx.

add(name: str^{938}) \rightarrow None<sup>939</sup>

Register a custom Sphinx event.

connect(name: str^{940}, callback: Callable^{941}, priority: int^{942}) \rightarrow int^{943}

Connect a handler to specific event.

disconnect(listener\_id: int^{944}) \rightarrow None<sup>945</sup>

Disconnect a handler.

emit(name: str^{946}, *args: Any^{947}, allowed\_exceptions: tuple^{948}[type^{949}[Exception^{950}], ...] = ()) \rightarrow list^{951}

Emit a Sphinx event.

emit_firstresult(name: str^{952}, *args: Any^{953}, allowed\_exceptions: tuple^{954}[type^{955}[Exception^{956}], ...] = ()) \rightarrow Any^{957}
```

Emit a Sphinx event and returns first result.

This returns the result of the first handler that doesn't return None.

Deprecated APIs

On developing Sphinx, we are always careful to the compatibility of our APIs. But, sometimes, the change of interface are needed for some reasons. In such cases, we've marked them as deprecated. And they are kept during the two major versions (for more details, please see *Deprecation policy*).

The following is a list of deprecated interfaces.

Table 4: deprecated APIs

| | | 1000000 711 15 | |
|--|-----------------|----------------|--|
| Target | Depre- cated | Re- moved | Alternatives |
| Old-style Makefiles in sphinx-quickstart and the -M, -m,no-use-make-mode, anduse-make-mode options | 7.3 | 9.0 | Vendoring the old style Makefile templates ⁹⁵⁸ |
| <pre>sphinx.ext.autodoc. preserve_defaults. get_function_def()</pre> | 7.2 | 9.0 | N/A (replacement is private) |
| <pre>sphinx.builders.html. StandaloneHTMLBuilder.css_files</pre> | 7.2 | 9.0 | N/A |

⁹⁵⁸ https://github.com/sphinx-doc/sphinx/blob/v7.0.0/sphinx/templates/quickstart/Makefile_t 959 https://pypi.org/project/sphinxcontrib-websupport/

Note: On deprecating on public APIs (internal functions and classes), we also follow the policy as much as possible.

CHAPTER

EIGHT

GET SUPPORT

For questions or to report problems with Sphinx, join the sphinx-users 960 mailing list on Google Groups, come to the #sphinx-doc channel on libera.chat⁹⁶¹, or open an issue at the tracker⁹⁶².

Examples of other projects using Sphinx can be found in the *examples page*. A useful tutorial 963 has been written by the matplotlib developers.

There is a translation team in Transifex⁹⁶⁴ of this documentation, thanks to the Sphinx document translators.

⁹⁶⁰ https://groups.google.com/group/sphinx-users 961 https://web.libera.chat/?channel=#sphinx-doc

⁹⁶² https://github.com/sphinx-doc/sphinx/issues

⁹⁶³ https://matplotlib.sourceforge.net/sampledoc/

https://www.transifex.com/sphinx-doc/sphinx-doc/dashboard/

CONTRIBUTE TO SPHINX

This guide contains information about the Sphinx open source project itself. This is where you can find information about how Sphinx is managed and learn how to contribute to the project.

9.1 Contributing to Sphinx

There are many ways you can contribute to Sphinx, be it filing bug reports or feature requests, writing new documentation or submitting patches for new or fixed behavior. This guide serves to illustrate how you can get started with this.

Get help

The Sphinx community maintains a number of mailing lists and IRC channels.

Stack Overflow with tag python-sphinx Page 381, 965

Questions and answers about use and development.

sphinx-users <sphinx-users@googlegroups.com>

Mailing list for user support.

sphinx-dev <sphinx-dev@googlegroups.com>

Mailing list for development related discussions.

#sphinx-doc on irc.libera.chat

IRC channel for development questions and user support.

Bug Reports and Feature Requests

If you have encountered a problem with Sphinx or have an idea for a new feature, please submit it to the issue tracker on GitHub or discuss it on the sphinx-dev mailing list.

For bug reports, please include the output produced during the build process and also the log file Sphinx creates after it encounters an unhandled exception. The location of this file should be shown towards the end of the error message.

Including or providing a link to the source files involved may help us fix the issue. If possible, try to create a minimal project that produces the error and post that instead.

⁹⁶⁵ https://stackoverflow.com/questions/tagged/python-sphinx

⁹⁶⁶ https://github.com/sphinx-doc/sphinx/issues

⁹⁶⁷ sphinx-dev@googlegroups.com

Contribute code

The Sphinx source code is managed using Git and is hosted on GitHub⁹⁶⁸. The recommended way for new contributors to submit code to Sphinx is to fork this repository and submit a pull request after committing changes to their fork. The pull request will then need to be approved by one of the core developers before it is merged into the main repository.

Getting started

Before starting on a patch, we recommend checking for open issues or open a fresh issue to start a discussion around a feature idea or a bug. If you feel uncomfortable or uncertain about an issue or your changes, feel free to email the *sphinx-dev* mailing list.

These are the basic steps needed to start developing on Sphinx.

- 1. Create an account on GitHub.
- 2. Fork the main Sphinx repository (sphinx-doc/sphinx⁹⁶⁹) using the GitHub interface.
- 3. Clone the forked repository to your machine.

```
git clone https://github.com/USERNAME/sphinx cd sphinx
```

4. Checkout the appropriate branch.

Sphinx adopts Semantic Versioning 2.0.0 (refs: https://semver.org/).

For changes that preserves backwards-compatibility of API and features, they should be included in the next MINOR release, use the A.x branch.

```
git checkout A.x
```

For incompatible or other substantial changes that should wait until the next MAJOR release, use the master branch.

For urgent release, a new PATCH branch must be branched from the newest release tag (see *Sphinx's release process* for detail).

5. Setup a virtual environment.

This is not necessary for unit testing, thanks to tox, but it is necessary if you wish to run sphinx-build locally or run unit tests without the help of tox:

```
virtualenv ~/.venv
. ~/.venv/bin/activate
pip install -e .
```

6. Create a new working branch. Choose any name you like.

```
git checkout -b feature-xyz
```

7. Hack, hack, hack.

Write your code along with tests that shows that the bug was fixed or that the feature works as expected.

8. Add a bullet point to CHANGES.rst if the fix or feature is not trivial (small doc updates, typo fixes), then commit:

⁹⁶⁸ https://github.com/sphinx-doc/sphinx

⁹⁶⁹ https://github.com/sphinx-doc/sphinx

```
git commit -m '#42: Add useful new feature that does this.'
```

GitHub recognizes certain phrases that can be used to automatically update the issue tracker. For example:

```
git commit -m 'Closes #42: Fix invalid markup in docstring of Foo.bar.'
```

would close issue #42.

9. Push changes in the branch to your forked repository on GitHub:

```
git push origin feature-xyz
```

- 10. Submit a pull request from your branch to the respective branch (master or A.x).
- 11. Wait for a core developer to review your changes.

Coding style

Please follow these guidelines when writing code for Sphinx:

- Try to use the same code style as used in the rest of the project.
- For non-trivial changes, please update the CHANGES.rst file. If your changes alter existing behavior, please
 document this.
- New features should be documented. Include examples and use cases where appropriate. If possible, include a sample that is displayed in the generated output.
- When adding a new configuration variable, be sure to document it and update sphinx/cmd/quickstart.py if it's important enough.
- Add appropriate unit tests.

Style and type checks can be run as follows:

```
ruff .
mypy sphinx/
```

Unit tests

Sphinx is tested using pytest⁹⁷⁰ for Python code and Karma⁹⁷¹ for JavaScript.

To run Python unit tests, we recommend using tox, which provides a number of targets and allows testing against multiple different Python environments:

• To list all possible targets:

```
tox -av
```

• To run unit tests for a specific Python version, such as Python 3.10:

```
tox -e py310
```

• To run unit tests for a specific Python version and turn on deprecation warnings so they're shown in the test output:

⁹⁷⁰ https://docs.pytest.org/en/latest/

⁹⁷¹ https://karma-runner.github.io

```
PYTHONWARNINGS=error tox -e py310
```

• Arguments to pytest can be passed via tox, e.g., in order to run a particular test:

```
tox -e py310 tests/test_module.py::test_new_feature
```

You can also test by installing dependencies in your local environment:

```
pip install .[test]
```

To run JavaScript tests, use npm:

```
    npm install

    npm run test
```

New unit tests should be included in the tests directory where necessary:

- For bug fixes, first add a test that fails without your changes and passes after they are applied.
- Tests that need a sphinx-build run should be integrated in one of the existing test modules if possible. New tests that to @with_app and then build_all for a few assertions are not good since the test suite should not take more than a minute to run.

New in version 1.8: Sphinx also runs JavaScript tests.

New in version 1.6: sphinx.testing is added as a experimental.

Changed in version 1.5.2: Sphinx was switched from nose to pytest.

Todo: The below belongs in the developer guide

Utility functions and pytest fixtures for testing are provided in sphinx.testing. If you are a developer of Sphinx extensions, you can write unit tests by using pytest. At this time, sphinx.testing will help your test implementation.

How to use pytest fixtures that are provided by sphinx.testing? You can require 'sphinx.testing.fixtures' in your test modules or conftest.py files like this:

```
pytest_plugins = 'sphinx.testing.fixtures'
```

If you want to know more detailed usage, please refer to tests/conftest.py and other test_*.py files under the tests directory.

Contribute documentation

Contributing to documentation involves modifying the source files found in the doc/ folder. To get started, you should first follow *Getting started*, and then take the steps below to work with the documentation.

The following sections describe how to get started with contributing documentation, as well as key aspects of a few different tools that we use.

Todo: Add a more extensive documentation contribution guide.

Build the documentation

To build the documentation, run the following command:

```
sphinx-build -M html ./doc ./build/sphinx -W --keep-going
```

This will parse the Sphinx documentation's source files and generate HTML for you to preview in build/sphinx/html.

You can also build a **live version of the documentation** that you can preview in the browser. It will detect changes and reload the page any time you make edits. To do so, run the following command:

```
sphinx-autobuild ./doc ./build/sphinx/
```

Translations

The parts of messages in Sphinx that go into builds are translated into several locales. The translations are kept as gettext .po files translated from the master template sphinx/locale/sphinx.pot.

Sphinx uses Babel⁹⁷² to extract messages and maintain the catalog files. The utils directory contains a helper script, babel_runner.py.

- Use python babel_runner.py extract to update the .pot template.
- Use python babel_runner.py update to update all existing language catalogs in sphinx/locale/*/ LC_MESSAGES with the current messages in the template file.
- Use python babel_runner.py compile to compile the .po files to binary .mo files and .js files.

When an updated .po file is submitted, run python babel_runner.py compile to commit both the source and the compiled catalogs.

When a new locale is submitted, add a new directory with the ISO 639-1 language identifier and put sphinx.po in there. Don't forget to update the possible values for *language* in doc/usage/configuration.rst.

The Sphinx core messages can also be translated on Transifex⁹⁷³. There tx client tool, which is provided by the transifex_client Python package, can be used to pull translations in .po format from Transifex. To do this, go to sphinx/locale and then run tx pull -f -l LANG where LANG is an existing language identifier. It is good practice to run python babel_runner.py update afterwards to make sure the .po file has the canonical Babel formatting.

Debugging tips

- Delete the build cache before building documents if you make changes in the code by running the command make clean or using the *sphinx-build -E* option.
- Use the *sphinx-build -P* option to run pdb on exceptions.
- Use node.pformat() and node.asdom().toxml() to generate a printable representation of the document structure.
- Set the configuration variable *keep_warnings* to True so warnings will be displayed in the generated output.
- Set the configuration variable *nitpicky* to True so that Sphinx will complain about references without a known target.
- Set the debugging options in the Docutils configuration file⁹⁷⁴.

⁹⁷² https://babel.pocoo.org/en/latest/

⁹⁷³ https://www.transifex.com/sphinx-doc/sphinx-1/

⁹⁷⁴ https://docutils.sourceforge.io/docs/user/config.html

JavaScript stemming algorithms in sphinx/search/non-minified-js/*.js are generated using snowball⁹⁷⁵ by cloning the repository, executing make dist_libstemmer_js and then unpacking the tarball which is generated in dist directory.

Minified files in sphinx/search/minified-js/*.js are generated from non-minified ones using uglifyjs (installed via npm), with -m option to enable mangling.

9.2 Sphinx's release process

Versioning

Sphinx adheres to **PEP 440**⁹⁷⁶ versions, with a major.minor.micro scheme for the *release segment* (e.g. 1.2.3). The major, minor, and micro version parts should be altered as follows:

- The major version part should be incremented for incompatible behavior change and public API updates.
- The minor version part should be incremented for most releases of Sphinx, where backwards-compatibility of API and features are preserves.
- The micro version part should only be incremented for urgent bugfix-only releases.

When the major version part is incremented, the minor and micro version parts must be set to 0. When the minor version part is incremented, the micro version part must be set to 0.

New major versions should come with a beta-testing period before the final release.

Deprecating a feature

There are a couple reasons that code in Sphinx might be deprecated:

- If a feature has been improved or modified in a backwards-incompatible way, the old feature or behavior will be deprecated.
- Sometimes Sphinx will include a backport of a Python library that's not included in a version of Python that Sphinx currently supports. When Sphinx no longer needs to support the older version of Python that doesn't include the library, the library will be deprecated in Sphinx.

As the *Deprecation policy* describes, the first release of Sphinx that deprecates a feature (A.B) should raise a RemovedInSphinxXXWarning (where XX is the Sphinx version where the feature will be removed) when the deprecated feature is invoked. Assuming we have good test coverage, these warnings are converted to errors when running the test suite with warnings enabled:

pytest -Wall

Thus, when adding a RemovedInSphinxXXWarning you need to eliminate or silence any warnings generated when running the tests.

⁹⁷⁵ https://github.com/snowballstem/snowball

⁹⁷⁶ https://peps.python.org/pep-0440/

Deprecation policy

MAJOR and MINOR releases may deprecate certain features from previous releases. If a feature is deprecated in a release A.x, it will continue to work in all A.x.x versions (for all versions of x). It will continue to work in all B.x.x versions but raise deprecation warnings. Deprecated features will be removed at the C.0.0. It means the deprecated feature will work during 2 MAJOR releases at least.

So, for example, if we decided to start the deprecation of a function in Sphinx 2.x:

- Sphinx 2.x will contain a backwards-compatible replica of the function which will raise a RemovedInSphinx40Warning. This is a subclass of PendingDeprecationWarning⁹⁷⁷, i.e. it will not get displayed by default.
- Sphinx 3.x will still contain the backwards-compatible replica, but RemovedInSphinx40Warning will be a subclass of DeprecationWarning⁹⁷⁸ then, and gets displayed by default.
- Sphinx 4.0 will remove the feature outright.

Deprecation warnings

Sphinx will enable its RemovedInNextVersionWarning warnings by default, if PYTHONWARNINGS⁹⁷⁹ is not set. Therefore you can disable them using:

- PYTHONWARNINGS= make html (Linux/Mac)
- export PYTHONWARNINGS= and do make html (Linux/Mac)
- set PYTHONWARNINGS= and do make html (Windows)

But you can also explicitly enable the pending ones using e.g. PYTHONWARNINGS=default (see the Python docs on configuring warnings⁹⁸⁰) for more details.

Python version support policy

Sphinx supports at all minor versions of Python released in the past 42 months from the anticipated release date with a minimum of 3 minor versions of Python. This policy is derived from NEP 29^{981} , a scientific Python domain standard.

For example, a version of Sphinx released in May 2024 would support Python 3.10, 3.11, and 3.12.

This is a summary table with the current policy:

| Date | Python |
|-------------|--------|
| 26 Dec 2021 | 3.8+ |
| 14 Apr 2023 | 3.9+ |
| 05 Apr 2024 | 3.10+ |
| 04 Apr 2025 | 3.11+ |

Release procedures

The release procedures are listed in utils/release-checklist.rst.

9.3 Organization of the Sphinx project

The guide explains how the Sphinx project is organized.

Core developers

The core developers of Sphinx have write access to the main repository. They can commit changes, accept/reject pull requests, and manage items on the issue tracker.

Guidelines

The following are some general guidelines for core developers:

- Questionable or extensive changes should be submitted as a pull request instead of being committed directly to the main repository. The pull request should be reviewed by another core developer before it is merged.
- Trivial changes can be committed directly but be sure to keep the repository in a good working state and that all tests pass before pushing your changes.
- When committing code written by someone else, please attribute the original author in the commit message and any relevant CHANGES.rst entry.

Membership

Core membership is predicated on continued active contribution to the project. In general, prospective cores should demonstrate:

- a good understanding of one of more components of Sphinx
- · a history of helpful, constructive contributions
- a willingness to invest time improving Sphinx

Refer to Contributing to Sphinx for more information on how you can get started.

Other contributors

You do not need to be a core developer or have write access to be involved in the development of Sphinx. You can submit patches or create pull requests from forked repositories and have a core developer add the changes for you.

Similarly, contributions are not limited to code patches. We also welcome help triaging bugs, input on design decisions, reviews of existing patches and documentation improvements. More information can be found in *Contributing to Sphinx*.

A list of people that have contributed to Sphinx can be found in *Sphinx authors*.

9.4 Sphinx Code of Conduct

Like the technical community as a whole, the Sphinx team and community is made up of volunteers from all over the world. Diversity is a strength, but it can also lead to communication issues and unhappiness. To that end, we have a few ground rules that we ask people to adhere to.

- · Be friendly and patient.
- **Be welcoming.** We strive to be a community that welcomes and supports people of all backgrounds and identities. This includes, but is not limited to members of any race, ethnicity, culture, national origin, colour, immigration status, social and economic class, educational level, sex, sexual orientation, gender identity and expression, age, size, family status, political belief, religion, and mental and physical ability.
- **Be considerate.** Your work will be used by other people, and you in turn will depend on the work of others. Any decision you take will affect users and colleagues, and you should take those consequences into account when making decisions. Remember that we're a world-wide community, so you might not be communicating in someone else's primary language.
- **Be respectful.** Not all of us will agree all the time, but disagreement is no excuse for poor behavior and poor manners. We might all experience some frustration now and then, but we cannot allow that frustration to turn into a personal attack. It's important to remember that a community where people feel uncomfortable or threatened is not a productive one. Members of the Sphinx community should be respectful when dealing with other members as well as with people outside the Sphinx community.
- Be careful in the words that you choose. We are a community of professionals, and we conduct ourselves professionally. Be kind to others. Do not insult or put down other participants. Harassment and other exclusionary behavior aren't acceptable. This includes, but is not limited to:
 - Violent threats or language directed against another person.
 - Discriminatory jokes and language.
 - Posting sexually explicit or violent material.
 - Posting (or threatening to post) other people's personally identifying information ("doxing").
 - Personal insults, especially those using racist or sexist terms.
 - Unwelcome sexual attention.
 - Advocating for, or encouraging, any of the above behavior.
 - Repeated harassment of others. In general, if someone asks you to stop, then stop.
- When we disagree, try to understand why. Disagreements, both social and technical, happen all the time and Sphinx is no exception. It is important that we resolve disagreements and differing views constructively. Remember that we're different. Different people have different perspectives on issues. Being unable to understand why someone holds a viewpoint doesn't mean that they're wrong. Don't forget that it is human to err and blaming each other doesn't get us anywhere. Instead, focus on helping to resolve issues and learning from mistakes.

This isn't an exhaustive list of things that you can't do. Rather, take it in the spirit in which it's intended - a guide to make it easier to enrich all of us and the technical communities in which we participate. This code of conduct applies to all spaces of the Sphinx community.

SPHINX FAQ

This is a list of Frequently Asked Questions about Sphinx. Feel free to suggest new entries!

10.1 How do I...

... create PDF files without LaTeX?

rinohtype 982 provides a PDF builder that can be used as a drop-in replacement for the LaTeX builder.

... get section numbers?

They are automatic in LaTeX output; for HTML, give a :numbered: option to the *toctree* directive where you want to start numbering.

... customize the look of the built HTML files?

Use themes, see HTML Theming.

... add global substitutions or includes?

Add them in the *rst_prolog* or *rst_epilog* config value.

... display the whole TOC tree in the sidebar?

Use the toctree callable in a custom layout template, probably in the sidebartoc block.

... write my own extension?

See the *Extension tutorials*.

... convert from my existing docs using MoinMoin markup?

The easiest way is to convert to xhtml, then convert xhtml to reST⁹⁸³. You'll still need to mark up classes and such, but the headings and code examples come through cleanly.

For many more extensions and other contributed stuff, see the sphinx-contrib⁹⁸⁴ repository.

⁹⁸² https://github.com/brechtm/rinohtype

⁹⁸³ https://docutils.sourceforge.io/sandbox/xhtml2rest/xhtml2rest.py

⁹⁸⁴ https://github.com/sphinx-contrib/

10.2 Using Sphinx with...

Read the Docs

Read the Docs⁹⁸⁵ is a documentation hosting service based around Sphinx. They will host sphinx documentation, along with supporting a number of other features including version support, PDF generation, and more. The Getting Started⁹⁸⁶ guide is a good place to start.

Epydoc

There's a third-party extension providing an api role⁹⁸⁷ which refers to Epydoc's API docs for a given identifier.

Doxygen

Michael Jones is developing a reST/Sphinx bridge to doxygen called breathe⁹⁸⁸.

SCons

Glenn Hutchings has written a SCons build script to build Sphinx documentation; it is hosted here: https://bitbucket-archive.softwareheritage.org/projects/zo/zondo/sphinx-scons.html

PvPI

Jannis Leidel wrote a setuptools command⁹⁸⁹ that automatically uploads Sphinx documentation to the PyPI package documentation area at https://pythonhosted.org/.

GitHub Pages

Please add *sphinx.ext.githubpages* to your project. It allows you to publish your document in GitHub Pages. It generates helper files for GitHub Pages on building HTML document automatically.

MediaWiki

See sphinx-wiki⁹⁹⁰, a project by Kevin Dunn.

Google Analytics

You can use a custom layout.html template, like this:

```
{% extends "!layout.html" %}
{%- block extrahead %}
{{ super() }}
<script>
 var _gaq = _gaq || [];
  _gaq.push(['_setAccount', 'XXX account number XXX']);
  _gaq.push(['_trackPageview']);
</script>
{% endblock %}
{% block footer %}
{{ super() }}
<div class="footer">This page uses <a href="https://analytics.google.com/">
Google Analytics</a> to collect statistics. You can disable it by blocking
the JavaScript coming from www.google-analytics.com.
<script>
  (function() {
    var ga = document.createElement('script');
    ga.src = ('https:' == document.location.protocol ?
                                                                        (continues on next page)
```

⁹⁸⁵ https://readthedocs.org

 $^{^{986}\} https://docs.readthedocs.io/en/stable/intro/getting-started-with-sphinx.html$

⁹⁸⁷ https://git.savannah.gnu.org/cgit/kenozooid.git/tree/doc/extapi.py

⁹⁸⁸ https://github.com/michaeljones/breathe/tree/master

⁹⁸⁹ https://pypi.org/project/Sphinx-PyPI-upload/

⁹⁹⁰ https://bitbucket-archive.softwareheritage.org/projects/ke/kevindunn/sphinx-wiki.html

(continued from previous page)

```
 'https://ssl' : 'https://www') + '.google-analytics.com/ga.js';
   ga.setAttribute('async', 'true');
   document.documentElement.firstChild.appendChild(ga);
   })();
   </script>
   </div>
   {% endblock %}
```

Google Search

To replace Sphinx's built-in search function with Google Search, proceed as follows:

- 1. Go to https://cse.google.com/cse/all to create the Google Search code snippet.
- 2. Copy the code snippet and paste it into _templates/searchbox.html in your Sphinx project:

3. Add searchbox.html to the html_sidebars configuration value.

10.3 Sphinx vs. Docutils

tl;dr: *docutils* converts reStructuredText to multiple output formats. Sphinx builds upon docutils to allow construction of cross-referenced and indexed bodies of documentation.

docutils ⁹⁹¹ is a text processing system for converting plain text documentation into other, richer formats. As noted in the docutils documentation ⁹⁹², docutils uses *readers* to read a document, *parsers* for parsing plain text formats into an internal tree representation made up of different types of *nodes*, and *writers* to output this tree in various document formats. docutils provides parsers for one plain text format - reStructuredText ⁹⁹³ - though other, *out-of-tree* parsers have been implemented including Sphinx's *Markdown parser*. On the other hand, it provides writers for many different formats including HTML, LaTeX, man pages, Open Document Format and XML.

docutils exposes all of its functionality through a variety of front-end tools⁹⁹⁴, such as rst2html, rst2odt and rst2xml. Crucially though, all of these tools, and docutils itself, are concerned with individual documents. They don't support concepts such as cross-referencing, indexing of documents, or the construction of a document hierarchy (typically manifesting in a table of contents).

```
991 https://docutils.sourceforge.io/
```

⁹⁹² https://docutils.sourceforge.io/docs/dev/hacking.html

⁹⁹³ https://docutils.sourceforge.io/rst.html

⁹⁹⁴ https://docutils.sourceforge.io/docs/user/tools.html

Sphinx builds upon docutils by harnessing docutils' readers and parsers and providing its own *Builders*. As a result, Sphinx wraps some of the *writers* provided by docutils. This allows Sphinx to provide many features that would simply not be possible with docutils, such as those outlined above.

10.4 Epub info

The following list gives some hints for the creation of epub files:

- Split the text into several files. The longer the individual HTML files are, the longer it takes the ebook reader to render them. In extreme cases, the rendering can take up to one minute.
- Try to minimize the markup. This also pays in rendering time.
- For some readers you can use embedded or external fonts using the CSS @font-face directive. This is *extremely* useful for code listings which are often cut at the right margin. The default Courier font (or variant) is quite wide and you can only display up to 60 characters on a line. If you replace it with a narrower font, you can get more characters on a line. You may even use FontForge⁹⁹⁵ and create narrow variants of some free font. In my case I get up to 70 characters on a line.

You may have to experiment a little until you get reasonable results.

- Test the created epubs. You can use several alternatives. The ones I am aware of are Epubcheck⁹⁹⁶, Calibre⁹⁹⁷, FBreader⁹⁹⁸ (although it does not render the CSS), and Bookworm⁹⁹⁹. For Bookworm, you can download the source from https://code.google.com/archive/p/threepress and run your own local server.
- Large floating divs are not displayed properly. If they cover more than one page, the div is only shown on the first page. In that case you can copy the epub.css from the sphinx/themes/epub/static/directory to your local _static/ directory and remove the float settings.
- Files that are inserted outside of the toctree directive must be manually included. This sometimes applies to appendixes, e.g. the glossary or the indices. You can add them with the <code>epub_post_files</code> option.
- The handling of the epub cover page differs from the reStructuredText procedure which automatically resolves image paths and puts the images into the _images directory. For the epub cover page put the image in the html_static_path directory and reference it with its full path in the epub_cover config option.
- kindlegen¹⁰⁰⁰ command can convert from epub3 resulting file to .mobi file for Kindle. You can get yourdoc. mobi under _build/epub after the following command:

```
$ make epub
$ kindlegen _build/epub/yourdoc.epub
```

The kindlegen command doesn't accept documents that have section titles surrounding toctree directive:

```
Section Title

... toctree::

subdocument

(continues on next page)
```

995 https://fontforge.github.io/

⁹⁹⁶ https://github.com/IDPF/epubcheck

⁹⁹⁷ https://calibre-ebook.com/

⁹⁹⁸ https://fbreader.org/

⁹⁹⁹ https://www.oreilly.com/bookworm/index.html

¹⁰⁰⁰ https://www.amazon.com/gp/feature.html?docId=1000765211

(continued from previous page)

```
Section After Toc Tree
```

kindlegen assumes all documents order in line, but the resulting document has complicated order for kindlegen:

```
(``parent.xhtml`` -> ``child.xhtml`` -> ``parent.xhtml``
```

If you get the following error, fix your document structure:

```
Error(prcgen):E24011: TOC section scope is not included in the parent chapter:(title)
Error(prcgen):E24001: The table of content could not be built.
```

10.5 Texinfo info

There are two main programs for reading Info files, info and GNU Emacs. The info program has less features but is available in most Unix environments and can be quickly accessed from the terminal. Emacs provides better font and color display and supports extensive customization (of course).

Displaying Links

One noticeable problem you may encounter with the generated Info files is how references are displayed. If you read the source of an Info file, a reference to this section would look like:

```
* note Displaying Links: target-id
```

In the stand-alone reader, info, references are displayed just as they appear in the source. Emacs, on the other-hand, will by default replace *note: with see and hide the target-id. For example:

```
Displaying Links
```

One can disable generation of the inline references in a document with texinfo_cross_references. That makes an info file more readable with stand-alone reader (info).

The exact behavior of how Emacs displays references is dependent on the variable Info-hide-note-references. If set to the value of hide, Emacs will hide both the *note: part and the target-id. This is generally the best way to view Sphinx-based documents since they often make frequent use of links and do not take this limitation into account. However, changing this variable affects how all Info documents are displayed and most do take this behavior into account.

If you want Emacs to display Info files produced by Sphinx using the value hide for Info-hide-note-references and the default value for all other Info files, try adding the following Emacs Lisp code to your start-up file, ~/.emacs.d/init.el.

(continues on next page)

10.5. Texinfo info 395

(continued from previous page)

Notes

The following notes may be helpful if you want to create Texinfo files:

- Each section corresponds to a different node in the Info file.
- Colons (:) cannot be properly escaped in menu entries and xrefs. They will be replaced with semicolons (;).
- Links to external Info files can be created using the somewhat official URI scheme info. For example:

```
info:Texinfo#makeinfo_options
```

11.3 Former maintainers

Listed alphabetically in forename, surname order

Former maintainers are those who haven't committed in the last two years. Those on the list below may become active maintainers again at any time.

- Armin Ronacher <@mitsuhiko>
- Daniel Neuhäuser <@DasIch>
- Georg Brandl <georg@python.org>
- Rob Ruana <@RobRuana>
- Robert Lehmann <@lehmannro>
- Timotheus Kampik <@TimKam>
- Yoshiki Shibukawa <@shibukawa>

Many thanks for all contributions!

COMMAND-LINE TOOLS

These are the applications provided as part of Sphinx.

12.1 Core Applications

sphinx-quickstart

Synopsis

sphinx-quickstart

Description

sphinx-quickstart is an interactive tool that asks some questions about your project and then generates a complete documentation directory and sample Makefile to be used with *sphinx-build(1)*.

Options

-q, --quiet

Quiet mode that skips the interactive wizard for specifying options. This option requires -p, -a and -v options.

-h, --help, --version

Display usage summary or Sphinx version.

Structure Options

--sep

If specified, separate source and build directories.

--no-sep

If specified, create build directory under source directory.

--dot=DOT

Inside the root directory, two more directories will be created; "_templates" for custom HTML templates and "_static" for custom stylesheets and other static files. You can enter another prefix (such as ".") to replace the underscore.

Project Basic Options

-p PROJECT, --project=PROJECT

Project name will be set. (see *project*).

-a AUTHOR, --author=AUTHOR

Author names. (see copyright).

-v VERSION

Version of project. (see *version*).

-r RELEASE, --release=RELEASE

Release of project. (see release).

-1 LANGUAGE, --language=LANGUAGE

Document language. (see language).

--suffix=SUFFIX

Source file suffix. (see *source_suffix*).

--master=MASTER

Master document name. (see root_doc).

Extension Options

--ext-autodoc

Enable sphinx.ext.autodoc extension.

--ext-doctest

Enable sphinx.ext.doctest extension.

--ext-intersphinx

Enable sphinx.ext.intersphinx extension.

--ext-todo

Enable sphinx.ext.todo extension.

--ext-coverage

Enable sphinx.ext.coverage extension.

--ext-imgmath

Enable *sphinx.ext.imgmath* extension.

--ext-mathjax

Enable sphinx.ext.mathjax extension.

--ext-ifconfig

Enable sphinx.ext.ifconfig extension.

--ext-viewcode

Enable sphinx.ext.viewcode extension.

--ext-githubpages

Enable sphinx.ext.githubpages extension.

--extensions=EXTENSIONS

Enable arbitrary extensions.

Makefile and Batchfile Creation Options

--use-make-mode (-m), --no-use-make-mode (-M)

Makefile/make.bat uses (or doesn't use) *make-mode*. Default is use, which generates a more concise Makefile/make.bat.

Changed in version 1.5: make-mode is default.

Changed in version 7.3: Support for disabling the make-mode will be removed in Sphinx 8.

--makefile, --no-makefile

Create (or not create) makefile.

--batchfile, --no-batchfile

Create (or not create) batchfile

Project templating

New in version 1.5: Project templating options for sphinx-quickstart

-t, --templatedir=TEMPLATEDIR

Template directory for template files. You can modify the templates of sphinx project files generated by quick-start. Following Jinja2 template files are allowed:

- root_doc.rst_t
- conf.py_t
- Makefile_t
- Makefile.new_t
- make.bat_t
- make.bat.new_t

In detail, please refer the system template files Sphinx provides. (sphinx/templates/quickstart)

-d NAME=VALUE

Define a template variable

See also

sphinx-build(1)

sphinx-build

Synopsis

sphinx-build [options] <sourcedir> <outputdir> [filenames ...]

Description

sphinx-build generates documentation from the files in <sourcedir> and places it in the <outputdir>.

sphinx-build looks for <**sourcedir**>/**conf.py** for the configuration settings. *sphinx-quickstart(1)* may be used to generate template files, including **conf.py**.

sphinx-build can create documentation in different formats. A format is selected by specifying the builder name on the command line; it defaults to HTML. Builders can also perform other tasks related to documentation processing. For a list of available builders, refer to *Builders*.

By default, everything that is outdated is built. Output only for selected files can be built by specifying individual filenames.

Options

-M buildername

Select a builder, using the *make-mode*. See *Builders* for a list of all of Sphinx's built-in builders. Extensions can add their own builders.

Important: Sphinx only recognizes the -M option if it is used first, along with the source and output directories, before any other options are passed. For example:

```
sphinx-build -M html ./source ./build -W --keep-going
```

The *make-mode* provides the same build functionality as a default *Makefile or Make.bat*, and provides the following additional build pipelines:

latexpdf

Build LaTeX files and run them through **pdflatex**, or as per *latex_engine* setting. If *language* is set to 'ja', will use automatically the **platex/dvipdfmx** latex to PDF pipeline.

info

Build Texinfo files and run them through makeinfo.

Note: The default output directory locations when using *make-mode* differ from the defaults when using -b.

- doctrees are saved to <outputdir>/doctrees
- output files are saved to <outputdir>/<builder name>

New in version 1.2.1.

-b buildername, --builder buildername

Selects a builder.

See Builders for a list of all of Sphinx's built-in builders. Extensions can add their own builders.

Changed in version 7.3: Add --builder long option.

-a, --write-all

If given, always write all output files. The default is to only write output files for new and changed source files. (This may not apply to all builders.)

Note: This option does not re-read source files. To read and re-process every file, use --fresh-env instead.

Changed in version 7.3: Add --write-all long option.

-E, --fresh-env

Don't use a saved *environment* (the structure caching all cross-references), but rebuild it completely. The default is to only read and parse source files that are new or have changed since the last run.

Changed in version 7.3: Add --fresh-env long option.

-t tag, --tag tag

Define the tag tag. This is relevant for only directives that only include their content if this tag is set.

New in version 0.6.

Changed in version 7.3: Add --tag long option.

-d path, --doctree-dir path

Since Sphinx has to read and parse all source files before it can write an output file, the parsed source files are cached as "doctree pickles". Normally, these files are put in a directory called .doctrees under the build directory; with this option you can select a different cache directory (the doctrees can be shared between all builders).

Changed in version 7.3: Add --doctree-dir long option.

-j N, --jobs N

Distribute the build over *N* processes in parallel, to make building on multiprocessor machines more effective. Note that not all parts and not all builders of Sphinx can be parallelized. If auto argument is given, Sphinx uses the number of CPUs as *N*.

New in version 1.2: This option should be considered *experimental*.

Changed in version 1.7: Support auto argument.

Changed in version 6.2: Add --jobs long option.

-c path, --config-dir path

Don't look for the conf.py in the source directory, but use the given configuration directory instead. Note that various other files and paths given by configuration values are expected to be relative to the configuration directory, so they will have to be present at this location too.

New in version 0.3.

Changed in version 7.3: Add --config-dir long option.

-C, --isolated

Don't look for a configuration file; only take options via the --define option.

New in version 0.5.

Changed in version 7.3: Add --isolated long option.

-D setting=value, --define setting=value

Override a configuration value set in the conf.py file. The value must be a number, string, list or dictionary value.

For lists, you can separate elements with a comma like this: -D html_theme_path=path1,path2.

For dictionary values, supply the setting name and key like this: -D latex_elements.docclass=scrartcl.

For boolean values, use 0 or 1 as the value.

Changed in version 0.6: The value can now be a dictionary value.

Changed in version 1.3: The value can now also be a list value.

Changed in version 7.3: Add --define long option.

-A name=value, --html-define name=value

Make the *name* assigned to *value* in the HTML templates.

New in version 0.5.

Changed in version 7.3: Add --html-define long option.

-n, --nitpicky

Run in nit-picky mode. Currently, this generates warnings for all missing references. See the config value *nitpick_ignore* for a way to exclude some references as "known missing".

Changed in version 7.3: Add --nitpicky long option.

-N, --no-color

Do not emit colored output.

Changed in version 1.6: Add --no-color long option.

--color

Emit colored output. Auto-detected by default.

New in version 1.6.

-v, --verbose

Increase verbosity (log-level). This option can be given up to three times to get more debug logging output. It implies -T.

New in version 1.2.

Changed in version 7.3: Add --verbose long option.

-q, --quiet

Do not output anything on standard output, only write warnings and errors to standard error.

Changed in version 7.3: Add --quiet long option.

-O. --silent

Do not output anything on standard output, also suppress warnings. Only errors are written to standard error.

Changed in version 7.3: Add --silent long option.

-w file, --warning-file file

Write warnings (and errors) to the given file, in addition to standard error.

Changed in version 7.3: ANSI control sequences are stripped when writing to file.

Changed in version 7.3: Add --warning-file long option.

-W, --fail-on-warning

Turn warnings into errors. This means that the build stops at the first warning and sphinx-build exits with exit status 1.

Changed in version 7.3: Add --fail-on-warning long option.

--keep-going

With -W option, keep going processing when getting warnings to the end of build, and sphinx-build exits with exit status 1.

New in version 1.8.

-T, --show-traceback

Display the full traceback when an unhandled exception occurs. Otherwise, only a summary is displayed and the traceback information is saved to a file for further analysis.

New in version 1.2.

Changed in version 7.3: Add --show-traceback long option.

-P, --pdb

(Useful for debugging only.) Run the Python debugger, pdb¹⁰⁰¹, if an unhandled exception occurs while building.

Changed in version 7.3: Add --pdb long option.

-h, --help, --version

Display usage summary or Sphinx version.

New in version 1.2.

You can also give one or more filenames on the command line after the source and build directories. Sphinx will then try to build only these output files (and their dependencies).

Environment Variables

The **sphinx-build** refers following environment variables:

MAKE

A path to make command. A command name is also allowed. **sphinx-build** uses it to invoke sub-build process on make-mode.

Makefile Options

The Makefile and make.bat files created by **sphinx-quickstart** usually run **sphinx-build** only with the -b and -d options. However, they support the following variables to customize behavior:

PAPER

This sets the 'papersize' key of latex_elements: i.e. PAPER=a4 sets it to 'a4paper' and PAPER=letter to 'letterpaper'.

Note: Usage of this environment variable got broken at Sphinx 1.5 as a4 or letter ended up as option to LaTeX document in place of the needed a4paper, resp. letterpaper. Fixed at 1.7.7.

SPHINXBUILD

The command to use instead of sphinx-build.

BUILDDIR

The build directory to use instead of the one chosen in **sphinx-quickstart**.

 $^{^{1001}\} https://docs.python.org/3/library/pdb.html\#module-pdb$

SPHINXOPTS

Additional options for **sphinx-build**. These options can also be set via the shortcut variable **O** (capital 'o').

NO_COLOR

When set (regardless of value), **sphinx-build** will not use color in terminal output. NO_COLOR takes precedence over FORCE_COLOR. See no-color.org 1002 for other libraries supporting this community standard.

New in version 4.5.0.

FORCE COLOR

When set (regardless of value), **sphinx-build** will use color in terminal output. NO_COLOR takes precedence over FORCE_COLOR.

New in version 4.5.0.

Deprecation Warnings

If any deprecation warning like RemovedInSphinxXXXWarning are displayed when building a user's document, some Sphinx extension is using deprecated features. In that case, please report it to author of the extension.

To disable the deprecation warnings, please set PYTHONWARNINGS= environment variable to your environment. For example:

- PYTHONWARNINGS= make html (Linux/Mac)
- export PYTHONWARNINGS= and do make html (Linux/Mac)
- set PYTHONWARNINGS= and do make html (Windows)
- · modify your Makefile/make.bat and set the environment variable

12.2 Additional Applications

sphinx-apidoc

Synopsis

sphinx-apidoc [OPTIONS] -o <OUTPUT_PATH> <MODULE_PATH> [EXCLUDE_PATTERN ...]

¹⁰⁰² https://no-color.org/

Description

sphinx-apidoc is a tool for automatic generation of Sphinx sources that, using the *autodoc* extension, document a whole package in the style of other automatic API documentation tools.

MODULE_PATH is the path to a Python package to document, and *OUTPUT_PATH* is the directory where the generated sources are placed. Any *EXCLUDE_PATTERNs* given are fnmatch-style¹⁰⁰³ file and/or directory patterns that will be excluded from generation.

Warning: sphinx-apidoc generates source files that use *sphinx.ext.autodoc* to document all found modules. If any modules have side effects on import, these will be executed by autodoc when sphinx-build is run.

If you document scripts (as opposed to library modules), make sure their main routine is protected by a if __name__ == '__main__' condition.

Options

-o <OUTPUT_PATH>

Directory to place the output files. If it does not exist, it is created.

-q

Do not output anything on standard output, only write warnings and errors to standard error.

-f, --force

Force overwriting of any existing generated files.

-1, --follow-links

Follow symbolic links. Defaults to False.

-n, --dry-run

Do not create any files.

-s <suffix>

Suffix for the source files generated. Defaults to rst.

-d <MAXDEPTH>

Maximum depth for the generated table of contents file. Defaults to 4.

--tocfile

Filename for a table of contents file. Defaults to modules.

-T. --no-toc

Do not create a table of contents file. Ignored when --full is provided.

-F, --full

Generate a full Sphinx project (conf.py, Makefile etc.) using the same mechanism as sphinx-quickstart.

-e, --separate

Put documentation for each module on its own page.

New in version 1.2.

¹⁰⁰³ https://docs.python.org/3/library/fnmatch.html

-E, --no-headings

Do not create headings for the modules/packages. This is useful, for example, when docstrings already contain headings.

-P, --private

Include "_private" modules.

New in version 1.2.

--implicit-namespaces

By default sphinx-apidoc processes sys.path searching for modules only. Python 3.3 introduced **PEP 420**¹⁰⁰⁴ implicit namespaces that allow module path structures such as foo/bar/module.py or foo/bar/baz/__init__. py (notice that bar and foo are namespaces, not modules).

Interpret paths recursively according to PEP-0420.

-M, --module-first

Put module documentation before submodule documentation.

These options are used when --full is specified:

-a

Append module_path to sys.path.

-H <project>

Sets the project name to put in generated files (see *project*).

-A <author>

Sets the author name(s) to put in generated files (see *copyright*).

-V <version>

Sets the project version to put in generated files (see *version*).

-R <release>

Sets the project release to put in generated files (see *release*).

Project templating

New in version 2.2: Project templating options for sphinx-apidoc

-t, --templatedir=TEMPLATEDIR

Template directory for template files. You can modify the templates of sphinx project files generated by apidoc. Following Jinja2 template files are allowed:

- module.rst_t
- package.rst_t
- toc.rst_t
- root_doc.rst_t
- conf.py_t
- Makefile_t
- Makefile.new_t
- make.bat_t

¹⁰⁰⁴ https://peps.python.org/pep-0420/

make.bat.new_t

In detail, please refer the system template files Sphinx provides. (sphinx/templates/apidoc and sphinx/templates/quickstart)

Environment

SPHINX_APIDOC_OPTIONS

A comma-separated list of option to append to generated automodule directives. Defaults to members, undoc-members, show-inheritance.

See also

sphinx-build(1), sphinx-autogen(1)

sphinx-autogen

Synopsis

sphinx-autogen [options] <sourcefile> ...

Description

sphinx-autogen is a tool for automatic generation of Sphinx sources that, using the *autodoc* extension, document items included in *autosummary* listing(s).

sourcefile is the path to one or more reStructuredText documents containing *autosummary* entries with the :toctree:: option set. *sourcefile* can be an fnmatch¹⁰⁰⁵-style pattern.

Options

-o <outputdir>

Directory to place the output file. If it does not exist, it is created. Defaults to the value passed to the :toctree: option.

-s <suffix>, --suffix <suffix>

Default suffix to use for generated files. Defaults to rst.

-t <templates>, --templates <templates>

Custom template directory. Defaults to None.

-i, --imported-members

Document imported members.

-a, --respect-module-all

Document exactly the members in a module's __all__ attribute.

¹⁰⁰⁵ https://docs.python.org/3/library/fnmatch.html#module-fnmatch

Example

Given the following directory structure:

```
      docs

      — index.rst

      — ...

      foobar

      — foo

      — __init__.py

      — bar

      — init__.py

      baz

      — __init__.py
```

and assuming docs/index.rst contained the following:

```
Modules
======
.. autosummary::
    :toctree: modules

foobar.foo
    foobar.bar
    foobar.bar
```

If you run the following:

```
$ PYTHONPATH=. sphinx-autogen docs/index.rst
```

then the following stub files will be created in docs:

```
docs
— index.rst
— modules
— foobar.bar.rst
— foobar.baz.rst
— foobar.foo.rst
```

and each of those files will contain a autodoc directive and some other information.

CHAPTER

THIRTEEN

GLOSSARY

builder

A class (inheriting from *Builder*) that takes parsed documents and performs an action on them. Normally, builders translate the documents to an output format, but it is also possible to use builders that e.g. check for broken links in the documentation, or build coverage information.

See Builders for an overview over Sphinx's built-in builders.

configuration directory

The directory containing conf.py. By default, this is the same as the *source directory*, but can be set differently with the **-c** command-line option.

directive

A reStructuredText markup element that allows marking a block of content with special meaning. Directives are supplied not only by docutils, but Sphinx and custom extensions can add their own. The basic directive syntax looks like this:

```
.. directivename:: argument ...
:option: value

Content of the directive.
```

See *Directives* for more information.

document name

Since reST source files can have different extensions (some people like .txt, some like .rst – the extension can be configured with <code>source_suffix</code>) and different OSes have different path separators, Sphinx abstracts them: <code>document names</code> are always relative to the <code>source directory</code>, the extension is stripped, and path separators are converted to slashes. All values, parameters and such referring to "documents" expect such document names.

Examples for document names are index, library/zipfile, or reference/datamodel/types. Note that there is no leading or trailing slash.

domain

A domain is a collection of markup (reStructuredText *directives* and *roles*) to describe and link to *objects* belonging together, e.g. elements of a programming language. Directive and role names in a domain have names like domain:name, e.g. py:function.

Having domains means that there are no naming problems when one set of documentation wants to refer to e.g. C++ and Python classes. It also means that extensions that support the documentation of whole new languages are much easier to write.

For more information, refer to *Domains*.

environment

A structure where information about all documents under the root is saved, and used for cross-referencing. The

environment is pickled after the parsing stage, so that successive runs only need to read and parse new and changed documents.

extension

A custom *role*, *directive* or other aspect of Sphinx that allows users to modify any aspect of the build process within Sphinx.

For more information, refer to *Extensions*.

master document

The document that contains the root toctree directive.

root document

Same as master document.

object

The basic building block of Sphinx documentation. Every "object directive" (e.g. *py:function* or *object*) creates such a block; and most objects can be cross-referenced to.

RemoveInSphinxXXXWarning

The feature which is warned will be removed in Sphinx-XXX version. It usually caused from Sphinx extensions which is using deprecated. See also *Deprecation Warnings*.

role

A reStructuredText markup element that allows marking a piece of text. Like directives, roles are extensible. The basic syntax looks like this: :rolename:`content`. See *Inline markup* for details.

source directory

The directory which, including its subdirectories, contains all source files for one Sphinx project.

reStructuredText

An easy-to-read, what-you-see-is-what-you-get plaintext markup syntax and parser system.

CHAPTER

FOURTEEN

CHANGELOG

14.1 Release 7.3.0 (in development)

Dependencies

Incompatible changes

Deprecated

• #11693¹⁰⁰⁶: Support for old-style Makefile and make.bat output in **sphinx-quickstart**, and the associated options -M, -m, --no-use-make-mode, and --use-make-mode.

Features added

- #11701¹⁰⁰⁷: HTML Search: Adopt the new search element. Patch by Bénédikt Tran.
- #11803¹⁰⁰⁸: autodoc: Use an overriden __repr__() function in an enum, if defined. Patch by Shengyu Zhang.
- #11892¹⁰⁰⁹: Improved performance when resolving cross references in cpp domain. Patch by Rouslan Korneychuk.
- #11981¹⁰¹⁰: Improve rendering of signatures using slice syntax, e.g., def foo(arg: np.float64[:,:]) -> None:

Bugs fixed

- #11959¹⁰¹¹: Fix multiple term matching when word appears in both title and document. Patch by Will Lachance.
- #11958¹⁰¹²: HTML Search: Fix partial matches overwriting full matches. Patch by William Lachance.
- #11944¹⁰¹³: Use anchor in search preview. Patch by Will Lachance.
- #11668¹⁰¹⁴: Raise a useful error when theme.conf is missing. Patch by Vinay Sajip.

¹⁰¹⁴ https://github.com/sphinx-doc/sphinx/issues/11668

- #11622¹⁰¹⁵: Ensure that the order of keys in searchindex. is is deterministic. Patch by Pietro Albini.
- #11617¹⁰¹⁶: ANSI control sequences are stripped from the output when writing to a warnings file with -w. Patch by Bénédikt Tran.
- #11666¹⁰¹⁷: Skip all hidden directories in CatalogRepository.pofiles. Patch by Aryaz Eghbali.
- #9686¹⁰¹⁸: html builder: Fix MathJax lazy loading when equations appear in titles. Patch by Bénédikt Tran.
- #11483¹⁰¹⁹: singlehtml builder: Fix MathJax lazy loading when the index does not contain any math equations. Patch by Bénédikt Tran.
- #11697¹⁰²⁰: HTML Search: add 'noindex' meta robots tag. Patch by James Addison.
- #11678¹⁰²¹: Fix a possible ZeroDivisionError in sphinx.ext.coverage. Patch by Stephen Finucane.
- #11756¹⁰²²: LaTeX: build error with recent TeXLive due to missing substitutefont package (triggered if using fontenc with T2A option and document language is not a Cyrillic one). Patch by Jean-François B.
- #11675¹⁰²³: Fix rendering of progression bars in environments that do not support ANSI control sequences. Patch by Bénédikt Tran.
- #11715¹⁰²⁴: Apply tls verify and tls cacerts config to ImageDownloader. Patch by Nick Touran.
- #114331025: Added the linkcheck_allow_unauthorized configuration option. Set this option to False to report HTTP 401 (unauthorized) server responses as broken. Patch by James Addison.
- #11868¹⁰²⁶: linkcheck: added a distinct timeout reporting status code. Patch by James Addison.
- #11869¹⁰²⁷: Refresh the documentation for the linkcheck_timeout setting. Patch by James Addison.
- #11874¹⁰²⁸: Configure a default 30-second value for linkcheck_timeout. Patch by James Addison.
- #11886¹⁰²⁹: Print the Jinja2 template path chain in TemplateNotFound exceptions. Patch by Colin Marquardt.
- #11598¹⁰³⁰: Do not use query components in URLs for assets in EPUB rendering. Patch by David Runge.
- #11917¹⁰³¹: Fix rendering of annotated inherited members for Python 3.9. Patch by Janet Carson.
- #11925¹⁰³²: Blacklist the sphinxprettysearchresults extension; the functionality it provides was merged into Sphinx v2.0.0. Patch by James Addison.
- #11962¹⁰³³: Fix target resolution when using :paramtype: fields. Patch by Bénédikt Tran.
- #12008¹⁰³⁴: Fix case-sensitive lookup of std:label names in intersphinx inventory. Patch by Michael Goerz.

- #11474¹⁰³⁵: Fix doctrees caching causing files not be rebuilt in some cases, e.g., when *numfig* is True. Patch by Bénédikt Tran.
- $\#11278^{1036}$: autodoc: Fix rendering of functools.singledispatchmethod 1037 combined with $@classmethod^{1038}$. Patch by Bénédikt Tran.

Testing

14.2 Release 7.2.6 (released Sep 13, 2023)

Bugs fixed

- #11679¹⁰³⁹: Add the SPHINX_AUTODOC_RELOAD_MODULES environment variable, which if set reloads modules when using autodoc with TYPE_CHECKING = True. Patch by Matt Wozniski and Adam Turner.
- #11679¹⁰⁴⁰: Use importlib.reload()¹⁰⁴¹ to reload modules in autodoc. Patch by Matt Wozniski and Adam Turner.

14.3 Release 7.2.5 (released Aug 30, 2023)

Bugs fixed

- #11645¹⁰⁴²: Fix a regression preventing autodoc from importing modules within packages that make use of if typing.TYPE_CHECKING: to guard circular imports needed by type checkers. Patch by Matt Wozniski.
- #11634¹⁰⁴³: Fixed inheritance diagram relative link resolution for sibling files in a subdirectory. Patch by Albert Shih.
- #11659¹⁰⁴⁴: Allow ?config=... in mathjax_path.
- #11654¹⁰⁴⁵: autodoc: Fail with a more descriptive error message when an object claims to be an instance of type, but is not a class. Patch by James Braza.
- 11620: Cease emitting *source-read* events for files read via the include ¹⁰⁴⁶ directive.
- 11620: Add a new include-read for observing and transforming the content of included files via the include 1047 directive
- #11627¹⁰⁴⁸: Restore support for copyright lines of the form YYYY when SOURCE_DATE_EPOCH is set.

14.4 Release 7.2.4 (released Aug 28, 2023)

Bugs fixed

- #11618¹⁰⁴⁹: Fix a regression in the MoveModuleTargets transform, introduced in #10478¹⁰⁵⁰ (#9662¹⁰⁵¹).
- #11649¹⁰⁵²: linkcheck: Resolve hanging tests for timezones west of London and incorrect conversion from UTC to offsets from the UNIX epoch. Patch by Dmitry Shachnev and Adam Turner.

14.5 Release 7.2.3 (released Aug 23, 2023)

Dependencies

• #11576¹⁰⁵³: Require sphinxcontrib-serializinghtml 1.1.9.

Bugs fixed

- Fix regression in autodoc.Documenter.parse_name().
- Fix regression in JSON serialisation.
- #11543¹⁰⁵⁴: autodoc: Support positional-only parameters in classmethod methods when autodoc_preserve_defaults is True.
- Restore support string methods on path objects. This is deprecated and will be removed in Sphinx 8. Use os. fspath() 1055 to convert Path 1056 objects to strings, or Path 1057's methods to work with path objects.

14.6 Release 7.2.2 (released Aug 17, 2023)

Bugs fixed

- Fix the signature of the StateMachine.insert_input() patch, for when calling with keyword arguments.
- Fixed membership testing (in) for the str¹⁰⁵⁸ interface of the asset classes (_CascadingStyleSheet and _JavaScript), which several extensions relied upon.
- Fixed a type error in SingleFileHTMLBuilder._get_local_toctree, includehidden may be passed as a string or a boolean.
- Fix :noindex: for PyModule and JSModule.

¹⁰⁵⁸ https://docs.python.org/3/library/stdtypes.html#str

14.7 Release 7.2.1 (released Aug 17, 2023)

Bugs fixed

- Restored the the str¹⁰⁵⁹ interface of the asset classes (_CascadingStyleSheet and _JavaScript), which several extensions relied upon. This will be removed in Sphinx 9.
- Restored calls to Builder.add_{css,js}_file(), which several extensions relied upon.
- Restored the private API TocTree.get_toctree_ancestors(), which several extensions relied upon.

14.8 Release 7.2.0 (released Aug 17, 2023)

Dependencies

- #11511¹⁰⁶⁰: Drop Python 3.8 support.
- #11576¹⁰⁶¹: Require Pygments 2.14 or later.

Deprecated

- #11512¹⁰⁶²: Deprecate sphinx.util.md5 and sphinx.util.sha1. Use hashlib instead.
- #11526¹⁰⁶³: Deprecate sphinx.testing.path. Use os.path or pathlib instead.
- #11528¹⁰⁶⁴: Deprecate sphinx.util.split_index_msg and sphinx.util.split_into. Use sphinx. util.index_entries.split_index_msg instead.
- Deprecate sphinx.builders.html.Stylesheet and sphinx.builders.html.Javascript. Use sphinx.application.Sphinx.add_css_file() and sphinx.application.Sphinx.add_js_file() instead.
- #11582¹⁰⁶⁵: Deprecate sphinx.builders.html.StandaloneHTMLBuilder.css_files and sphinx.builders.html.StandaloneHTMLBuilder.script_files. Use sphinx.application.Sphinx.add_css_file() and sphinx.application.Sphinx.add_js_file() instead.
- #11459¹⁰⁶⁶: Deprecate sphinx.ext.autodoc.preserve_defaults.get_function_def(). Patch by Bénédikt Tran.

¹⁰⁶⁵ https://github.com/sphinx-doc/sphinx/issues/11582

¹⁰⁶⁶ https://github.com/sphinx-doc/sphinx/issues/11459

Features added

- #11526¹⁰⁶⁷: Support os.PathLike types and pathlib.Path objects in many more places.
- #5474¹⁰⁶⁸: coverage: Print summary statistics tables. Patch by Jorge Leitao.
- #6319¹⁰⁶⁹: viewcode: Add *viewcode_line_numbers* to control whether line numbers are added to rendered source code. Patch by Ben Krikler.
- #9662¹⁰⁷⁰: Add the :no-typesetting: option to suppress textual output and only create a linkable anchor. Patch by Latosha Maltba.
- #11221¹⁰⁷¹: C++: Support domain objects in the table of contents. Patch by Rouslan Korneychuk.
- #10938¹⁰⁷²: doctest: Add *doctest_show_successes* option. Patch by Trey Hunner.
- #11533¹⁰⁷³: Add :no-index:, :no-index-entry:, and :no-contents-entry:.
- #11572¹⁰⁷⁴: Improve debug logging of reasons why files are detected as out of date. Patch by Eric Larson.
- #10678¹⁰⁷⁵: Emit *source-read* events for files read via the include ¹⁰⁷⁶ directive. Patch by Halldor Fannar.
- #11570¹⁰⁷⁷: Use short names when using **PEP 585**¹⁰⁷⁸ built-in generics. Patch by Riccardo Mori.
- #11300¹⁰⁷⁹: Improve SigElementFallbackTransform fallback logic and signature text elements nodes. See *the documentation* for more details. Patch by Bénédikt Tran.
- Allow running Sphinx with python -m sphinx build

- #11077¹⁰⁸⁰: graphviz: Fix relative links from within the graph. Patch by Ralf Grubenmann.
- #11529¹⁰⁸¹: Line Block in LaTeX builder outputs spurious empty token. Patch by Adrian Vollmer.
- #11196¹⁰⁸²: autosummary: Summary line extraction failed with "e.g."
- #10614¹⁰⁸³: Fixed a number of bugs in inheritance diagrams that resulted in missing or broken links. Patch by Albert Shih.
- #9428¹⁰⁸⁴: Exclude substitution definitions when running the gettext builder. Patch by Alvin Wong.
- #10795¹⁰⁸⁵: Raise a descriptive error if graphviz_dot is falsy.

- #11546¹⁰⁸⁶: Translated nodes identical to their original text are now marked with the translated=True attribute.
- #10049¹⁰⁸⁷: html: Change "Permalink" to "Link" for title text in link anchors.
- #4225¹⁰⁸⁸: Relax Pygments parsing on lexing failures.
- #11246¹⁰⁸⁹: Allow inline links in the first line of a docstring and one-line type comments #: :meta ...: when using *sphinx.ext.napoleon*. Patch by Bénédikt Tran.
- #10930¹⁰⁹⁰: Highlight all search terms on the search results page. Patch by Dmitry Shachnev.
- #11473¹⁰⁹¹: Type annotations containing Literal¹⁰⁹² enumeration values now render correctly. Patch by Bénédikt Tran.
- #11591¹⁰⁹³: Fix support for C coverage in sphinx.ext.coverage extension. Patch by Stephen Finucane.
- #11594¹⁰⁹⁴: HTML Theme: Enhancements to horizontal scrolling on smaller devices in the agogo theme. Patch by Lukas Engelter.
- #11459¹⁰⁹⁵: Fix support for async and lambda functions in sphinx.ext.autodoc.preserve_defaults. Patch by Bénédikt Tran.

Testing

- #11577¹⁰⁹⁶: pytest: Fail tests on "XPASS".
- #11577¹⁰⁹⁷: pytest: Use "importlib" import mode.
- #11577¹⁰⁹⁸: pytest: Set PYTHONWARNINGS=error.
- #11577¹⁰⁹⁹: pytest: Set strict config and strict markers.

14.9 Release 7.1.2 (released Aug 02, 2023)

Bugs fixed

• #11542¹¹⁰⁰: linkcheck: Properly respect *linkcheck_anchors* and do not spuriously report failures to validate anchors. Patch by James Addison.

14.10 Release 7.1.1 (released Jul 27, 2023)

Bugs fixed

• #11514¹¹⁰¹: Fix SOURCE DATE EPOCH in multi-line copyright footer. Patch by Bénédikt Tran.

14.11 Release 7.1.0 (released Jul 24, 2023)

Incompatible changes

• Releases are no longer signed, given the change in PyPI policy¹¹⁰².

Deprecated

• #11412¹¹⁰³: Emit warnings on using a deprecated Python-specific index entry type (namely, module, keyword, operator, object, exception, statement, and builtin) in the index directive, and set the removal version to Sphinx 9. Patch by Adam Turner.

- #114151104: Add a checksum to JavaScript and CSS asset URIs included within generated HTML, using the CRC32 algorithm.
- require_sphinx() now allows the version requirement to be specified as (major, minor).
- #11011¹¹⁰⁵: Allow configuring line-length limit object signatures, maximum_signature_line_length and the domain-specific variants. If the length of the signature (in characters) is greater than the configured limit, each parameter in the signature will be split to its own logical line. This behaviour may also be controlled by options on object description directives, for example py:function:single-line-parameter-list. Patch by Thomas Louf, Adam Turner, and Jean-François B.
- #10983¹¹⁰⁶: Support for multiline copyright statements in the footer block. Patch by Stefanie Molin
- sphinx.util.display.status_iterator now clears the current line with ANSI control codes, rather than overprinting with space characters.
- #11431¹¹⁰⁷: linkcheck: Treat SSL failures as broken links. Patch by James Addison.
- #11157¹¹⁰⁸: Keep the translated attribute on translated nodes.
- #11451¹¹⁰⁹: Improve the traceback displayed when using sphinx-build -T in parallel builds. Patch by Bénédikt Tran
- #11324¹¹¹⁰: linkcheck: Use session-basd HTTP requests.

1107 https://github.com/sphinx-doc/sphinx/issues/11431
1108 https://github.com/sphinx-doc/sphinx/issues/11157
```

¹¹⁰⁹ https://github.com/sphinx-doc/sphinx/issues/11451

¹¹¹⁰ https://github.com/sphinx-doc/sphinx/issues/11324

- #11438¹¹¹¹: Add support for the *py:class* and *py:function* directives for PEP 695 (generic classes and functions declarations) and PEP 696 (default type parameters). Multi-line support (#11011¹¹¹²) is enabled for type parameters list and can be locally controlled on object description directives, e.g., *py:function:single-line-type-parameter-list*. Patch by Bénédikt Tran.
- #11484¹¹¹³: linkcheck: Allow HTML anchors to be ignored on a per-URL basis via linkcheck_anchors_ignore_for_url while still checking the validity of the page itself. Patch by Bénédikt Tran
- #1246¹¹¹⁴: Add translation progress statistics and inspection support, via a new substitution (|translation progress|) and a new configuration variable (translation_progress_classes). These enable determining the percentage of translated elements within a document, and the remaining translated and untranslated elements.

- Restored the footnote-reference class that has been removed in the latest (unreleased) version of Docutils.
- #11486¹¹¹⁵: Use **RFC 8081**¹¹¹⁶ font file MIME types in the EPUB builder. Using the correct MIME type will prevent warnings from epubcheck and will generate a valid EPUB.
- #11435¹¹¹⁷: Use microsecond-resolution timestamps for outdated file detection in BuildEnvironment. get_outdated_files.
- #11437¹¹¹⁸: Top-level headings starting with a reStructuredText role now render properly when *rst_prolog* is set. Previously, a file starting with the below would have improperly rendered due to where the prologue text was inserted into the document.

Patch by Bénédikt Tran.

• #11337¹¹¹⁹: Fix a MemoryError in sphinx.ext.intersphinx when using None or typing.* as inline type references. Patch by Bénédikt Tran (picnixz)

Testing

• #11345¹¹²⁰: Always delete docutils.conf in test directories when running SphinxTestApp.cleanup().

14.12 Release 7.0.1 (released May 12, 2023)

Dependencies

• #11411¹¹²¹: Support Docutils 0.20¹¹²². Patch by Adam Turner.

Bugs fixed

• #11418¹¹²³: Clean up remaining references to sphinx.setup_command following the removal of support for setuptools. Patch by Willem Mulder.

14.13 Release 7.0.0 (released Apr 29, 2023)

Incompatible changes

- #11359¹¹²⁴: Remove long-deprecated aliases for MecabSplitter and DefaultSplitter in sphinx.search.ja.
- #11360¹¹²⁵: Remove deprecated make_old_id functions in domain object description classes.
- #11363¹¹²⁶: Remove the Setuptools integration (build_sphinx hook in setup.py).
- #11364¹¹²⁷: Remove deprecated sphinx.ext.napoleon.iterators module.
- #11365¹¹²⁸: Remove support for the jsdump format in sphinx.search.
- #11366¹¹²⁹: Make locale a required argument to sphinx.util.i18n.format_date().
- #11370¹¹³⁰: Remove deprecated sphinx.util.stemmer module.
- #11371¹¹³¹: Remove deprecated sphinx.pycode.ast.parse() function.
- #11372¹¹³²: Remove deprecated sphinx.io.read_doc() function.
- #11373¹¹³³: Removed deprecated sphinx.util.get_matching_files() function.
- #11378¹¹³⁴: Remove deprecated sphinx.util.docutils.is_html5_writer_available() function.
- #11379¹¹³⁵: Make the env argument to Builder subclasses required.
- #11380¹¹³⁶: autosummary: Always emit grouped import exceptions.

- #11381¹¹³⁷: Remove deprecated style key for HTML templates.
- #11382¹¹³⁸: Remove deprecated sphinx.writers.latex.LaTeXTranslator.docclasses attribute.
- #11383¹¹³⁹: Remove deprecated sphinx.builders.html.html5_ready and sphinx.builders.html. HTMLTranslator attributes.
- #11385¹¹⁴⁰: Remove support for HTML 4 output.

14.14 Release 6.2.1 (released Apr 25, 2023)

Bugs fixed

• #11355¹¹⁴¹: Revert the default type of *nitpick_ignore* and *nitpick_ignore_regex* to list.

14.15 Release 6.2.0 (released Apr 23, 2023)

Dependencies

• Require Docutils 0.18.1 or greater.

Incompatible changes

- LaTeX: removal of some internal TeX \dimen registers (not previously publicly documented) as per 5.1.0 code comments in sphinx.sty: \sphinxverbatimsep, \sphinxverbatimborder, \sphinxshadowsep, \sphinxshadowsize, and \sphinxshadowrule. (refs: #11105¹¹⁴²)
- Remove . egg support from pycode ModuleAnalyser; Python eggs are a now-obsolete binary distribution format
- #11089¹¹⁴³: Remove deprecated code in sphinx.builders.linkcheck. Patch by Daniel Eades
- Remove internal-only sphinx.locale.setlocale

Deprecated

- #11247¹¹⁴⁴: Deprecate the legacy intersphinx_mapping format
- sphinx.util.osutil.cd is deprecated in favour of contextlib.chdir.

¹¹⁴³ https://github.com/sphinx-doc/sphinx/issues/11089

¹¹⁴⁴ https://github.com/sphinx-doc/sphinx/issues/11247

- #11277¹¹⁴⁵: autoproperty allows the return type to be specified as a type comment (e.g., # type: () -> int). Patch by Bénédikt Tran
- #10811¹¹⁴⁶: Autosummary: extend __all__ to imported members for template rendering when option autosummary_ignore_module_all is set to False. Patch by Clement Pinard
- #11147¹¹⁴⁷: Add a content_offset parameter to nested_parse_with_titles(), allowing for correct line numbers during nested parsing. Patch by Jeremy Maitin-Shepard
- Update to Unicode CLDR 42
- Add a -- jobs synonym for -j. Patch by Hugo van Kemenade
- LaTeX: a command \sphinxbox for styling text elements with a (possibly rounded) box, optional background color and shadow, has been added. See *The \sphinxbox command*. (refs: #11224¹¹⁴⁸)
- LaTeX: add \sphinxstylenotetitle, ..., \sphinxstylewarningtitle, ..., for an extra layer of mark-up freeing up \sphinxstrong for other uses. See *Macros*. (refs: #11267¹¹⁴⁹)
- LaTeX: note¹¹⁵⁰, hint¹¹⁵¹, important¹¹⁵² and tip¹¹⁵³ can now each be styled as the other admonitions, i.e. possibly with a background color, individual border widths and paddings, possibly rounded corners, and optional shadow. See Additional CSS-like 'sphinxsetup' keys. (refs: #11234¹¹⁵⁴)
- LaTeX: admonitions and topic 1155 (and contents 1156) directives, and not only code-block, support box-decoration-break=slice.
- LaTeX: let rounded boxes support up to 4 distinct border-widths (refs: #11243¹¹⁵⁷)
- LaTeX: new options noteTextColor, noteTeXextras et al. See Additional CSS-like 'sphinxsetup' keys.
- LaTeX: support elliptical corners in rounded boxes. (refs: #11254¹¹⁵⁸)
- #11150¹¹⁵⁹: Include source location in highlighting warnings, when lexing fails. Patch by Jeremy Maitin-Shepard
- #11281¹¹⁶⁰: Support for imgmath_latex = 'tectonic' or = 'xelatex'. Patch by Dimitar Dimitrov
- #11109¹¹⁶¹, #9643¹¹⁶²: Add python_display_short_literal_types option for condensed rendering of Literal types.

¹¹⁶² https://github.com/sphinx-doc/sphinx/issues/9643

- #11079¹¹⁶³: LaTeX: figures with align attribute may disappear and strangely impact following lists
- #11093¹¹⁶⁴: LaTeX: fix "multiply-defined references" PDF build warnings when one or more reST labels directly precede an *py:module* or *automodule* directive. Patch by Bénédikt Tran (picnixz)
- #11110¹¹⁶⁵: LaTeX: Figures go missing from latex pdf if their files have the same base name and they use a post transform. Patch by aaron-cooper
- LaTeX: fix potential color leak from shadow to border of rounded boxes, if shadow color is set but border color
 is not
- LaTeX: fix unintended 1pt upwards vertical shift of code blocks frames respective to contents (when using rounded corners)
- #11235¹¹⁶⁶: LaTeX: added \color in topic (or admonition) contents may cause color leak to the shadow and border at a page break
- #11264¹¹⁶⁷: LaTeX: missing space before colon after "Voir aussi" for seealso directive in French
- #11268¹¹⁶⁸: LaTeX: longtable with left alignment breaks out of current list indentation context in PDF. Thanks to picnixz.
- #11274¹¹⁶⁹: LaTeX: external links are not properly escaped for \sphinxupquote compatibility
- #11147¹¹⁷⁰: Fix source file/line number info in object description content and in other uses of nested_parse_with_titles. Patch by Jeremy Maitin-Shepard.
- #11192¹¹⁷¹: Restore correct parallel search index building. Patch by Jeremy Maitin-Shepard
- Use the new Transifex tx client

Testing

- Fail testing when any Python warnings are emitted
- Migrate remaining unittest. TestCase style test functions to pytest style
- Remove tests that rely on setuptools

¹¹⁷¹ https://github.com/sphinx-doc/sphinx/issues/11192

14.16 Release 6.1.3 (released Jan 10, 2023)

Bugs fixed

- #11116¹¹⁷²: Reverted to previous Sphinx 5 node copying method
- #11117¹¹⁷³: Reverted changes to parallel image processing from Sphinx 6.1.0
- #11119¹¹⁷⁴: Supress ValueError in the linkcheck builder

14.17 Release 6.1.2 (released Jan 07, 2023)

Bugs fixed

- #11101¹¹⁷⁵: LaTeX: div.topic_padding key of sphinxsetup documented at 5.1.0 was implemented with name topic_padding
- #11099¹¹⁷⁶: LaTeX: shadowrule key of sphinxsetup causes PDF build to crash since Sphinx 5.1.0
- #11096¹¹⁷⁷: LaTeX: shadowsize key of sphinxsetup causes PDF build to crash since Sphinx 5.1.0
- #11095¹¹⁷⁸: LaTeX: shadow of topic¹¹⁷⁹ and contents¹¹⁸⁰ boxes not in page margin since Sphinx 5.1.0
- #11100¹¹⁸¹: Fix copying images when running under parallel mode.

14.18 Release 6.1.1 (released Jan 05, 2023)

Bugs fixed

• #11091¹¹⁸²: Fix util.nodes.apply_source_workaround for literal_block nodes with no source information in the node or the node's parents.

¹¹⁸² https://github.com/sphinx-doc/sphinx/issues/11091

14.19 Release 6.1.0 (released Jan 05, 2023)

Dependencies

• Adopted the Ruff¹¹⁸³ code linter.

Incompatible changes

• #10979¹¹⁸⁴: gettext: Removed support for pluralisation in get_translation. This was unused and complicated other changes to sphinx.locale.

Deprecated

- sphinx.util functions:
 - Renamed sphinx.util.typing.stringify() to sphinx.util.typing. stringify_annotation()
 - Moved sphinx.util.xmlname_checker() to sphinx.builders.epub3. _XML_NAME_PATTERN

Moved to sphinx.util.display:

- sphinx.util.status_iterator
- sphinx.util.display_chunk
- sphinx.util.SkipProgressMessage
- sphinx.util.progress_message

Moved to sphinx.util.http_date:

- sphinx.util.epoch_to_rfc1123
- sphinx.util.rfc1123_to_epoch

Moved to sphinx.util.exceptions:

- sphinx.util.save_traceback
- sphinx.util.format_exception_cut_frames

- Cache doctrees in the build environment during the writing phase.
- Make all writing phase tasks support parallel execution.
- #11072¹¹⁸⁵: Use PEP 604 (X | Y) display conventions for typing.Optional and typing.Optional types within the Python domain and autodoc.
- #10700¹¹⁸⁶: autodoc: Document typing.NewType() types as classes rather than 'data'.
- Cache doctrees between the reading and writing phases.

¹¹⁸³ https://github.com/charliermarsh/ruff

https://github.com/sphinx-doc/sphinx/issues/10979

¹¹⁸⁵ https://github.com/sphinx-doc/sphinx/issues/11072

¹¹⁸⁶ https://github.com/sphinx-doc/sphinx/issues/10700

- #10962¹¹⁸⁷: HTML: Fix the multi-word key name lookup table.
- Fixed support for Python 3.12 alpha 3 (changes in the enum module).
- #11069¹¹⁸⁸: HTML Theme: Removed outdated "shortcut" link relation keyword.
- #10952¹¹⁸⁹: Properly terminate parallel processes on programme interuption.
- #10988¹¹⁹⁰: Speed up TocTree.resolve() through more efficient copying.
- #6744¹¹⁹¹: LaTeX: support for seealso directive should be via an environment to allow styling.
- #11074¹¹⁹²: LaTeX: Can't change sphinxnote to use sphinxheavybox starting with 5.1.0

14.20 Release 6.0.1 (released Jan 05, 2023)

Dependencies

• Require Pygments 2.13 or later.

Bugs fixed

• #10944¹¹⁹³: imgmath: Fix resolving image paths for files in nested folders.

14.21 Release 6.0.0 (released Dec 29, 2022)

Dependencies

- #10468¹¹⁹⁴: Drop Python 3.6 support
- #10470¹¹⁹⁵: Drop Python 3.7, Docutils 0.14, Docutils 0.15, Docutils 0.16, and Docutils 0.17 support. Patch by Adam Turner

¹¹⁹⁴ https://github.com/sphinx-doc/sphinx/issues/10468

¹¹⁹⁵ https://github.com/sphinx-doc/sphinx/issues/10470

Incompatible changes

• #7405¹¹⁹⁶: Removed the jQuery and underscore.js JavaScript frameworks.

These frameworks are no longer be automatically injected into themes from Sphinx 6.0. If you develop a theme or extension that uses the jQuery, \$, or \$u global objects, you need to update your JavaScript to modern standards, or use the mitigation below.

The first option is to use the sphinxcontrib.jquery¹¹⁹⁷ extension, which has been developed by the Sphinx team and contributors. To use this, add sphinxcontrib.jquery to the extensions list in conf.py, or call app. setup_extension("sphinxcontrib.jquery") if you develop a Sphinx theme or extension.

The second option is to manually ensure that the frameworks are present. To re-add jQuery and underscore.js, you will need to copy jquery.js and underscore.js from the Sphinx repository to your static directory, and add the following to your layout.html:

Patch by Adam Turner.

- #10471¹¹⁹⁹, #10565¹²⁰⁰: Removed deprecated APIs scheduled for removal in Sphinx 6.0. See *Deprecated APIs* for details. Patch by Adam Turner.
- #10901¹²⁰¹: C Domain: Remove support for parsing pre-v3 style type directives and roles. Also remove associated configuration variables c_allow_pre_v3 and c_warn_on_allowed_pre_v3. Patch by Adam Turner.

Features added

• #10924¹²⁰²: LaTeX: adopt better looking defaults for tables and code-blocks. See <code>latex_table_style</code> and the pre_border-radius and pre_background-TeXcolor *Additional CSS-like 'sphinxsetup' keys* for the former defaults and how to re-enact them if desired.

Bugs fixed

• #10984¹²⁰³: LaTeX: Document latex_additional_files behavior for files with .tex extension.

```
https://github.com/sphinx-doc/sphinx/issues/7405https://github.com/sphinx-contrib/jquery/
```

14.22 Release 5.3.0 (released Oct 16, 2022)

- #10759¹²⁰⁴: LaTeX: add *latex_table_style* and support the 'booktabs', 'borderless', and 'colorrows' styles. (thanks to Stefan Wiehler for initial pull requests #6666¹²⁰⁵, #6671¹²⁰⁶)
- #10840¹²⁰⁷: One can cross-reference including an option value like :option:`--module=foobar`, :option:`--module[=foobar]`, or :option:`--module foobar`. Patch by Martin Liska.
- #10881¹²⁰⁸: autosectionlabel: Record the generated section label to the debug log.
- #10268¹²⁰⁹: Correctly URI-escape image filenames.
- #10887¹²¹⁰: domains: Allow sections in all the content of all object description directives (e.g. *py:function*). Patch by Adam Turner

14.23 Release 5.2.3 (released Sep 30, 2022)

- #10878¹²¹¹: Fix base64 image embedding in sphinx.ext.imgmath
- #10886¹²¹²: Add:nocontentsentry: flag and global domain table of contents entry control option. Patch by Adam Turner

14.24 Release 5.2.2 (released Sep 27, 2022)

• #10872¹²¹³: Restore link targets for autodoc modules to the top of content. Patch by Dominic Davis-Foster.

14.25 Release 5.2.1 (released Sep 25, 2022)

- #10861¹²¹⁴: Always normalise the pycon3 lexer to pycon.
- Fix using sphinx.ext.autosummary with modules containing titles in the module-level docstring.

14.26 Release 5.2.0.post0 (released Sep 24, 2022)

· Recreated source tarballs for Debian maintainers.

14.27 Release 5.2.0 (released Sep 24, 2022)

Dependencies

• #10356¹²¹⁵: Sphinx now uses declarative metadata with pyproject.toml to create packages, using PyPA's flit project as a build backend. Patch by Adam Turner.

Deprecated

• #10843¹²¹⁶: Support for HTML 4 output. Patch by Adam Turner.

- #10738¹²¹⁷: napoleon: Add support for docstring types using 'of', like type of type. Example: tuple of int.
- #10286¹²¹⁸: C++, support requires clauses not just between the template parameter lists and the declaration.
- #10755¹²¹⁹: linkcheck: Check the source URL of raw directives that use the url option.
- #10781¹²²⁰: Allow ref role to be used with definitions and fields.
- #10717¹²²¹: HTML Search: Increase priority for full title and subtitle matches in search results
- #10718¹²²²: HTML Search: Save search result score to the HTML element for debugging
- #10673¹²²³: Make toctree accept 'genindex', 'modindex' and 'search' docnames
- #6316¹²²⁴, #10804¹²²⁵: Add domain objects to the table of contents. Patch by Adam Turner
- #6692¹²²⁶: HTML Search: Include explicit *index* directive index entries in the search index and search results. Patch by Adam Turner
- #10816¹²²⁷: imgmath: Allow embedding images in HTML as base64
- #10854¹²²⁸: HTML Search: Use browser localstorage for highlight control, stop storing highlight parameters in URL query strings. Patch by Adam Turner.

¹²²⁷ https://github.com/sphinx-doc/sphinx/issues/10816

¹²²⁸ https://github.com/sphinx-doc/sphinx/issues/10854

- #10723¹²²⁹: LaTeX: 5.1.0 has made the 'sphinxsetup' verbatimwithframe=false become without effect.
- #10257¹²³⁰: C++, ensure consistent non-specialization template argument representation.
- #10729¹²³¹: C++, fix parsing of certain non-type template parameter packs.
- #10715¹²³²: Revert #10520¹²³³: "Fix" use of sidebar classes in agogo.css_t

14.28 Release 5.1.1 (released Jul 26, 2022)

Bugs fixed

- #10701¹²³⁴: Fix ValueError in the new deque based sphinx.ext.napolean iterator implementation.
- #10702¹²³⁵: Restore compatability with third-party builders.

14.29 Release 5.1.0 (released Jul 24, 2022)

Dependencies

• #10656¹²³⁶: Support Docutils 0.19¹²³⁷. Patch by Adam Turner.

Deprecated

- #10467¹²³⁸: Deprecated sphinx.util.stemmer in favour of snowballstemmer. Patch by Adam Turner.
- #9856¹²³⁹: Deprecated sphinx.ext.napoleon.iterators.

- #10444¹²⁴⁰: html theme: Allow specifying multiple CSS files through the stylesheet setting in theme.conf or by setting html_style to an iterable of strings.
- #10366¹²⁴¹: std domain: Add support for emphasising placeholders in *option* directives through a new *option_emphasise_placeholders* configuration option.

¹²⁴⁰ https://github.com/sphinx-doc/sphinx/issues/10444

¹²⁴¹ https://github.com/sphinx-doc/sphinx/issues/10366

- #10439¹²⁴²: std domain: Use the repr of some variables when displaying warnings, making whitespace issues easier to identify.
- #10571¹²⁴³: quickstart: Reduce content in the generated conf.py file. Patch by Pradyun Gedam.
- #10648¹²⁴⁴: LaTeX: CSS-named-alike additional 'sphinxsetup' keys allow to configure four separate borderwidths, four paddings, four corner radii, a shadow (possibly inset), colours for border, background, shadow for each of the code-block, topic, attention, caution, danger, error and warning directives.
- #10655¹²⁴⁵: LaTeX: Explain non-standard encoding in LatinRules.xdy
- #10599¹²⁴⁶: HTML Theme: Wrap consecutive footnotes in an <aside> element when using Docutils 0.18 or later, to allow for easier styling. This matches the behaviour introduced in Docutils 0.19. Patch by Adam Turner.
- #10518¹²⁴⁷: config: Add include_patterns as the opposite of exclude_patterns. Patch by Adam Turner.

- #10594¹²⁴⁸: HTML Theme: field term colons are doubled if using Docutils 0.18+
- #10596¹²⁴⁹: Build failure if Docutils version is 0.18 (not 0.18.1) due to missing Node, findall()
- #10506¹²⁵⁰: LaTeX: build error if highlighting inline code role in figure caption (refs: #10251¹²⁵¹)
- #10634¹²⁵²: Make -P (pdb) option work better with exceptions triggered from events
- #10550¹²⁵³: py domain: Fix spurious whitespace in unparsing various operators (+, -, ~, and **). Patch by Adam Turner (refs: #10551¹²⁵⁴).
- #10460¹²⁵⁵: logging: Always show node source locations as absolute paths.
- HTML Search: HTML tags are displayed as a part of object name
- HTML Search: search snipets should not be folded
- HTML Search: Minor errors are emitted on fetching search snipets
- HTML Search: The markers for header links are shown in the search result
- #10520¹²⁵⁶: HTML Theme: Fix use of sidebar classes in agogo.css_t.
- #6679¹²⁵⁷: HTML Theme: Fix inclusion of hidden toctrees in the agogo theme.
- #10566¹²⁵⁸: HTML Theme: Fix enable search shortcuts does not work
- #8686¹²⁵⁹: LaTeX: Text can fall out of code-block at end of page and leave artifact on next page

¹²⁵⁹ https://github.com/sphinx-doc/sphinx/issues/8686

- #10633¹²⁶⁰: LaTeX: user injected \color commands in topic or admonition boxes may cause color leaks in PDF due to upstream framed.sty¹²⁶¹ bug
- #10638¹²⁶²: LaTeX: framed coloured boxes in highlighted code (e.g. highlighted diffs using Pygments style 'manni') inherit thickness of code-block frame
- #10647¹²⁶³: LaTeX: Only one \label is generated for desc_signature node even if it has multiple node IDs
- #10579¹²⁶⁴: i18n: UnboundLocalError is raised on translating raw directive
- #9577¹²⁶⁵, #10088¹²⁶⁶: py domain: Fix warning for duplicate Python references when using : any: and autodoc.
- #10548¹²⁶⁷: HTML Search: fix minor summary issues.

14.30 Release 5.0.2 (released Jun 17, 2022)

Features added

• #10523¹²⁶⁸: HTML Theme: Expose the Docutils's version info tuple as a template variable, docutils_version_info. Patch by Adam Turner.

- #10538¹²⁶⁹: autodoc: Inherited class attribute having docstring is documented even if autodoc_inherit_docstring is disabled
- #10509¹²⁷⁰: autosummary: autosummary fails with a shared library
- #10497¹²⁷¹: py domain: Failed to resolve strings in Literal. Patch by Adam Turner.
- #10523¹²⁷²: HTML Theme: Fix double brackets on citation references in Docutils 0.18+. Patch by Adam Turner.
- #10534¹²⁷³: Missing CSS for nav.contents in Docutils 0.18+. Patch by Adam Turner.

14.31 Release 5.0.1 (released Jun 03, 2022)

Bugs fixed

- #10498¹²⁷⁴: gettext: TypeError is raised when sorting warning messages if a node has no line number. Patch by Adam Turner.
- #10493¹²⁷⁵: HTML Theme: topic ¹²⁷⁶ directive is rendered incorrectly with Docutils 0.18, Patch by Adam Turner.
- #10495¹²⁷⁷: IndexError is raised for a *kbd* role having a separator. Patch by Adam Turner.

14.32 Release 5.0.0 (released May 30, 2022)

Dependencies

5.0.0 b1

• #10164¹²⁷⁸: Support Docutils 0.18¹²⁷⁹. Patch by Adam Turner.

Incompatible changes

5.0.0 b1

- #10031¹²⁸⁰: autosummary: sphinx.ext.autosummary.import_by_name() now raises ImportExceptionGroup instead of ImportError when it failed to import target object. Please handle the exception if your extension uses the function to import Python object. As a workaround, you can disable the behavior via grouped_exception=False keyword argument until v7.0.
- #9962¹²⁸¹: texinfo: Customizing styles of emphasized text via @definfoenclose command was not supported because the command was deprecated since texinfo 6.8
- #2068¹²⁸²: intersphinx_disabled_reftypes has changed default value from an empty list to ['std:doc'] as avoid too surprising silent intersphinx resolutions. To migrate: either add an explicit inventory name to the references intersphinx should resolve, or explicitly set the value of this configuration variable to an empty list.
- #10197¹²⁸³: html theme: Reduce body_min_width setting in basic theme to 360px
- #9999¹²⁸⁴: LaTeX: separate terms from their definitions by a CR (refs: #9985¹²⁸⁵)
- #10062¹²⁸⁶: Change the default language to 'en' if any language is not set in conf.py

5.0.0 final

• #10474¹²⁸⁷: language does not accept None as it value. The default value of language becomes to 'en' now.

1286 https://github.com/sphinx-doc/sphinx/issues/10062
```

1287 https://github.com/sphinx-doc/sphinx/issues/10474

Patch by Adam Turner and Takeshi KOMIYA.

Deprecated

5.0.0 b1

• #10028¹²⁸⁸: jQuery and underscore.js will no longer be automatically injected into themes from Sphinx 6.0. If you develop a theme or extension that uses the jQuery, \$, or \$u global objects, you need to update your JavaScript or use the mitigation below.

To re-add jQuery and underscore.js, you will need to copy jquery.js and underscore.js from the Sphinx repository 1289 to your static directory, and add the following to your layout.html:

Patch by Adam Turner.

- setuptools integration. The build_sphinx sub-command for setup.py is marked as deprecated to follow the policy of setuptools team.
- The locale argument of sphinx.util.i18n:babel_format_date() becomes required
- The language argument of sphinx.util.i18n:format_date() becomes required
- sphinx.builders.html.html5_ready
- sphinx.io.read_doc()
- sphinx.util.docutils.__version_info__
- sphinx.util.docutils.is_html5_writer_available()
- sphinx.writers.latex.LaTeXWriter.docclasses

Features added

5.0.0 b1

- #9075¹²⁹⁰: autodoc: The default value of *autodoc_typehints_format* is changed to 'smart'. It will suppress the leading module names of typehints (ex. io.StringIO -> StringIO).
- #8417¹²⁹¹: autodoc: :inherited-members: option now takes multiple classes. It allows to suppress inherited members of several classes on the module at once by specifying the option to *automodule* directive
- #9792¹²⁹²: autodoc: Add new option for autodoc_typehints_description_target to include undocumented return values but not undocumented parameters.
- #10285¹²⁹³: autodoc: singledispatch functions having typehints are not documented

¹²⁸⁸ https://github.com/sphinx-doc/sphinx/issues/10028

¹²⁸⁹ https://github.com/sphinx-doc/sphinx/tree/v5.3.0/sphinx/themes/basic/static

¹²⁹⁰ https://github.com/sphinx-doc/sphinx/issues/9075

¹²⁹¹ https://github.com/sphinx-doc/sphinx/issues/8417

¹²⁹² https://github.com/sphinx-doc/sphinx/issues/9792

¹²⁹³ https://github.com/sphinx-doc/sphinx/issues/10285

- autodoc: autodoc_typehints_format now also applies to attributes, data, properties, and type variable bounds.
- #10258¹²⁹⁴: autosummary: Recognize a documented attribute of a module as non-imported
- #10028¹²⁹⁵: Removed internal usages of JavaScript frameworks (jQuery and underscore.js) and modernised doctools. js and searchtools. js to EMCAScript 2018. Patch by Adam Turner.
- #10302¹²⁹⁶: C++, add support for conditional expressions (?:).
- #5157¹²⁹⁷, #10251¹²⁹⁸: Inline code is able to be highlighted via role¹²⁹⁹ directive
- #10337¹³⁰⁰: Make sphinx-build faster by caching Publisher object during build. Patch by Adam Turner.

5.0.0 b1

- #10200¹³⁰¹: apidoc: Duplicated submodules are shown for modules having both .pyx and .so files. Patch by Adam Turner and Takeshi KOMIYA.
- #10279¹³⁰²: autodoc: Default values for keyword only arguments in overloaded functions are rendered as a string
- #10280¹³⁰³: autodoc: autodoc_docstring_signature unexpectedly generates return value typehint for constructors if docstring has multiple signatures
- #10266¹³⁰⁴: autodoc: autodoc_preserve_defaults does not work for mixture of keyword only arguments with/without defaults
- #10310¹³⁰⁵; autodoc: class methods are not documented when decorated with mocked function
- #10305¹³⁰⁶: autodoc: Failed to extract optional forward-ref'ed typehints correctly via autodoc_type_aliases
- #10421¹³⁰⁷: autodoc: autodoc_preserve_defaults doesn't work on class methods
- #10214¹³⁰⁸: html: invalid language tag was generated if *language* contains a country code (ex. zh CN)
- #9974¹³⁰⁹: html: Updated jQuery version from 3.5.1 to 3.6.0
- #10236¹³¹⁰: html search: objects are duplicated in search result
- #9962¹³¹¹: texinfo: Deprecation message for @definfoenclose command on bulding texinfo document
- #10000¹³¹²: LaTeX: glossary terms with common definition are rendered with too much vertical whitespace

- #10363¹³¹⁴: LaTeX: make 'howto' title page rule use \linewidth for compatibility with usage of a twocolumn class option
- #10318¹³¹⁵: :prepend: option of literalinclude directive does not work with :dedent: option

5.0.0 final

- #9575¹³¹⁶: The annotation of return autodoc: value should not be shown when autodoc_typehints="description"
- #96481317: autodoc: *args and **kwargs entries are duplicated when autodoc_typehints="description"
- #8180¹³¹⁸: autodoc: Docstring metadata ignored for attributes
- #10443¹³¹⁹: epub: EPUB builder can't detect the mimetype of .webp file
- #10104¹³²⁰: gettext: Duplicated locations are shown if 3rd party extension does not provide correct information
- #10456¹³²¹: py domain: :meta: fields are displayed if docstring contains two or more meta-field
- #9096¹³²²: sphinx-build: the value of progress bar for paralle build is wrong
- #101101323: sphinx-build: exit code is not changed when error is raised on builder-finished event

14.33 Release 4.5.0 (released Mar 28, 2022)

Incompatible changes

- #10112¹³²⁴: extlinks: Disable hardcoded links detector by default
- #9993¹³²⁵, #10177¹³²⁶: std domain: Disallow to refer an inline target via ref role

Deprecated

• sphinx.ext.napoleon.docstring.GoogleDocstring._qualify_name()

¹³²⁵ https://github.com/sphinx-doc/sphinx/issues/9993

¹³²⁶ https://github.com/sphinx-doc/sphinx/issues/10177

Features added

- #10260¹³²⁷: Enable FORCE_COLOR and NO_COLOR for terminal colouring
- #10234¹³²⁸: autosummary: Add "autosummary" CSS class to summary tables
- #10125¹³²⁹: extlinks: Improve suggestion message for a reference having title
- #10112¹³³⁰: extlinks: Add extlinks_detect_hardcoded_links to enable hardcoded links detector feature
- #9494¹³³¹, #9456¹³³²: html search: Add a config variable html_show_search_summary to enable/disable the search summaries
- #9337¹³³³: HTML theme, add option enable_search_shortcuts that enables / as a Quick search shortcut and Esc shortcut that removes search highlighting.
- #10107¹³³⁴: i18n: Allow to suppress translation warnings by adding #noqa comment to the tail of each translation message
- #10252¹³³⁵: C++, support attributes on classes, unions, and enums.
- #10253¹³³⁶: pep role now generates URLs based on peps.python.org¹³³⁷

- #9876¹³³⁸: autodoc: Failed to document an imported class that is built from native binary module
- #10133¹³³⁹: autodoc: Crashed when mocked module is used for type annotation
- #10146¹³⁴⁰: autodoc: autodoc_default_options does not support no-value option
- #9971¹³⁴¹: autodoc: TypeError is raised when the target object is annotated by unhashable object
- #10205¹³⁴²: extlinks: Failed to compile regexp on checking hardcoded links
- #10277¹³⁴³: html search: Could not search short words (ex. "use")
- #9529¹³⁴⁴: LaTeX: named auto numbered footnote (ex. [#named]) that is referred multiple times was rendered to a question mark
- #9924¹³⁴⁵: LaTeX: multi-line *cpp: function* directive has big vertical spacing in Latexpdf
- #10158¹³⁴⁶: LaTeX: excessive whitespace since v4.4.0 for undocumented variables/structure members

¹³⁴⁵ https://github.com/sphinx-doc/sphinx/issues/9924

¹³⁴⁶ https://github.com/sphinx-doc/sphinx/issues/10158

- #10175¹³⁴⁷: LaTeX: named footnote reference is linked to an incorrect footnote if the name is also used in the different document
- #10269¹³⁴⁸: manpage: Failed to resolve the title of *ref* cross references
- #10179¹³⁴⁹: i18n: suppress "rST localization" warning
- #10118¹³⁵⁰: imgconverter: Unnecessary availablity check is called for remote URIs
- #10181¹³⁵¹: napoleon: attributes are displayed like class attributes for google style docstrings when napoleon_use_ivar is enabled
- #10122¹³⁵²: sphinx-build: make.bat does not check the installation of sphinx-build command before showing help

14.34 Release 4.4.0 (released Jan 17, 2022)

Dependencies

- #10007¹³⁵³: Use importlib_metadata for python-3.9 or older
- #10007¹³⁵⁴: Drop setuptools

- #9075¹³⁵⁵: autodoc: Add a config variable *autodoc_typehints_format* to suppress the leading module names of typehints of function signatures (ex. io.StringIO -> StringIO)
- #9831¹³⁵⁶: Autosummary now documents only the members specified in a module's __all__ attribute if autosummary_ignore_module_all is set to False. The default behaviour is unchanged. Autogen also now supports this behavior with the --respect-module-all switch.
- #9555¹³⁵⁷: autosummary: Improve error messages on failure to load target object
- #9800¹³⁵⁸: extlinks: Emit warning if a hardcoded link is replaceable by an extlink, suggesting a replacement.
- #9961¹³⁵⁹: html: Support nested <kbd> HTML elements in other HTML builders
- #10013¹³⁶⁰: html: Allow to change the loading method of JS via loading_method parameter for *Sphinx*. add_js_file()
- #9551¹³⁶¹: html search: "Hide Search Matches" link removes "highlight" parameter from URL
- #9815¹³⁶²; html theme: Wrap sidebar components in div to allow customizing their layout via CSS

¹³⁵⁷ https://github.com/sphinx-doc/sphinx/issues/9555

¹³⁵⁸ https://github.com/sphinx-doc/sphinx/issues/9800

¹³⁵⁹ https://github.com/sphinx-doc/sphinx/issues/9961

¹³⁶⁰ https://github.com/sphinx-doc/sphinx/issues/10013

¹³⁶¹ https://github.com/sphinx-doc/sphinx/issues/9551

¹³⁶² https://github.com/sphinx-doc/sphinx/issues/9815

- #9827¹³⁶³: i18n: Sort items in glossary by translated terms
- #9899¹³⁶⁴: py domain: Allows to specify cross-reference specifier (. and ~) as :type: option
- #9894¹³⁶⁵: linkcheck: add option linkcheck_exclude_documents to disable link checking in matched documents.
- #9793¹³⁶⁶: sphinx-build: Allow to use the parallel build feature in macOS on macOS and Python3.8+
- #10055¹³⁶⁷: sphinx-build: Create directories when -w option given
- #9993¹³⁶⁸: std domain: Allow to refer an inline target (ex. _`target name`) via *ref* role
- #9981¹³⁶⁹: std domain: Strip value part of the option directive from general index
- #9391¹³⁷⁰: texinfo: improve variable in samp role
- #9578¹³⁷¹: texinfo: Add texinfo_cross_references to disable cross references for readability with standalone readers
- #9822¹³⁷² (and #9062¹³⁷³), add new Intersphinx role *external* for explict lookup in the external projects, without resolving to the local project.

- #9866¹³⁷⁴: autodoc: doccomment for the imported class was ignored
- #9883¹³⁷⁵: autodoc: doccomment for the alias to mocked object was ignored
- #9908¹³⁷⁶: autodoc: debug message is shown on building document using NewTypes with Python 3.10
- #9968¹³⁷⁷: autodoc: instance variables are not shown if __init__ method has position-only-arguments
- #9194¹³⁷⁸: autodoc: types under the "typing" module are not hyperlinked
- #10009¹³⁷⁹: autodoc: Crashes if target object raises an error on getting docstring
- #10058¹³⁸⁰: autosummary: Imported members are not shown when autodoc_class_signature = 'separated'
- #9947¹³⁸¹: i18n: topic directive having a bullet list can't be translatable
- #9878¹³⁸²: mathjax: MathJax configuration is placed after loading MathJax itself

¹³⁸¹ https://github.com/sphinx-doc/sphinx/issues/9947

¹³⁸² https://github.com/sphinx-doc/sphinx/issues/9878

- #9932¹³⁸³: napoleon: empty "returns" section is generated even if no description
- #9857¹³⁸⁴: Generated RFC links use outdated base url
- #9909¹³⁸⁵: HTML, prevent line-wrapping in literal text.
- #10061¹³⁸⁶: html theme: Configuration values added by themes are not be able to override from conf.py
- #10073¹³⁸⁷: imgconverter: Unnecessary availablity check is called for "data" URIs
- #9925¹³⁸⁸: LaTeX: prohibit also with 'xelatex' line splitting at dashes of inline and parsed literals
- #9944¹³⁸⁹: LaTeX: extra vertical whitespace for some nested declarations
- #9940¹³⁹⁰: LaTeX: Multi-function declaration in Python domain has cramped vertical spacing in latexpdf output
- #10015¹³⁹¹: py domain: types under the "typing" module are not hyperlinked defined at info-field-list
- #9390¹³⁹²: texinfo: Do not emit labels inside footnotes
- #9413¹³⁹³: xml: Invalid XML was generated when cross referencing python objects
- #9979¹³⁹⁴: Error level messages were displayed as warning messages
- #10057¹³⁹⁵: Failed to scan documents if the project is placed onto the root directory
- #9636¹³⁹⁶: code-block: :dedent: without argument did strip newlines

14.35 Release 4.3.2 (released Dec 19, 2021)

Bugs fixed

• #9917¹³⁹⁷: C and C++, parse fundamental types no matter the order of simple type specifiers.

14.36 Release 4.3.1 (released Nov 28, 2021)

Features added

• #9864¹³⁹⁸: mathjax: Support chnaging the loading method of MathJax to "defer" via mathjax_options

¹³⁸³ https://github.com/sphinx-doc/sphinx/issues/9932

¹³⁸⁴ https://github.com/sphinx-doc/sphinx/issues/9857

¹³⁸⁵ https://github.com/sphinx-doc/sphinx/issues/9909

¹³⁸⁷ https://github.com/sphinx-doc/sphinx/issues/10073

¹³⁸⁸ https://github.com/sphinx-doc/sphinx/issues/9925

¹³⁸⁹ https://github.com/sphinx-doc/sphinx/issues/9944

¹³⁹⁰ https://github.com/sphinx-doc/sphinx/issues/9940

¹³⁹¹ https://github.com/sphinx-doc/sphinx/issues/10015

¹³⁹² https://github.com/sphinx-doc/sphinx/issues/9390

¹³⁹³ https://github.com/sphinx-doc/sphinx/issues/9413

¹³⁹⁴ https://github.com/sphinx-doc/sphinx/issues/9979

¹³⁹⁵ https://github.com/sphinx-doc/sphinx/issues/10057

¹³⁹⁶ https://github.com/sphinx-doc/sphinx/issues/9636

¹³⁹⁷ https://github.com/sphinx-doc/sphinx/issues/9917

¹³⁹⁸ https://github.com/sphinx-doc/sphinx/issues/9864

- #9838¹³⁹⁹: autodoc: AttributeError is raised on building document for functions decorated by functions.lru_cache
- #9879¹⁴⁰⁰: autodoc: AttributeError is raised on building document for an object having invalid __doc__ attribute
- #9844¹⁴⁰¹: autodoc: Failed to process a function wrapped with functools.partial if autodoc_preserve_defaults enabled
- #9872¹⁴⁰²: html: Class namespace collision between autodoc signatures and Docutils 0.17
- #9868¹⁴⁰³: imgmath: Crashed if the dvisvgm command failed to convert equation
- #9864¹⁴⁰⁴: mathjax: Failed to render equations via MathJax v2. The loading method of MathJax is back to "async" method again

14.37 Release 4.3.0 (released Nov 11, 2021)

Dependencies

• Support Python 3.10

Incompatible changes

- #9649¹⁴⁰⁵: searchindex.js: the embedded data has changed format to allow objects with the same name in different domains.
- #9672¹⁴⁰⁶: The rendering of Python domain declarations is implemented with more Docutils nodes to allow better CSS styling. It may break existing styling.
- #9672¹⁴⁰⁷: the signature of domains.python.PyObject.get_signature_prefix has changed to return a list of nodes instead of a plain string.
- #9695¹⁴⁰⁸: domains.js.JSObject.display_prefix has been changed into a method get_display_prefix which now returns a list of nodes instead of a plain string.
- #9695¹⁴⁰⁹: The rendering of Javascript domain declarations is implemented with more Docutils nodes to allow better CSS styling. It may break existing styling.
- #9450¹⁴¹⁰: mathjax: Load MathJax via "defer" strategy

¹³⁹⁹ https://github.com/sphinx-doc/sphinx/issues/9838

¹⁴⁰⁰ https://github.com/sphinx-doc/sphinx/issues/9879

¹⁴⁰¹ https://github.com/sphinx-doc/sphinx/issues/9844

¹⁴⁰² https://github.com/sphinx-doc/sphinx/issues/9872

¹⁴⁰³ https://github.com/sphinx-doc/sphinx/issues/9868

¹⁴⁰⁴ https://github.com/sphinx-doc/sphinx/issues/9864

¹⁴⁰⁵ https://github.com/sphinx-doc/sphinx/issues/9649

¹⁴⁰⁶ https://github.com/sphinx-doc/sphinx/issues/9672

¹⁴⁰⁷ https://github.com/sphinx-doc/sphinx/issues/9672

¹⁴⁰⁸ https://github.com/sphinx-doc/sphinx/issues/9695

¹⁴⁰⁹ https://github.com/sphinx-doc/sphinx/issues/9695

¹⁴¹⁰ https://github.com/sphinx-doc/sphinx/issues/9450

Deprecated

- sphinx.ext.autodoc.AttributeDocumenter._datadescriptor
- sphinx.writers.html.HTMLTranslator._fieldlist_row_index
- sphinx.writers.html.HTMLTranslator._table_row_index
- sphinx.writers.html5.HTML5Translator._fieldlist_row_index
- sphinx.writers.html5.HTML5Translator._table_row_index

Features added

- #9639¹⁴¹¹: autodoc: Support asynchronous generator functions
- #9664¹⁴¹²: autodoc: autodoc-process-bases supports to inject reST snippet as a base class
- #9691¹⁴¹³: C, added new info-field retval for c: function and c:macro.
- C++, added new info-field retval for cpp: function.
- #9618¹⁴¹⁴: i18n: Add *gettext_allow_fuzzy_translations* to allow "fuzzy" messages for translation
- #9672¹⁴¹⁵: More CSS classes on Python domain descriptions
- #9695¹⁴¹⁶: More CSS classes on Javascript domain descriptions
- #9683¹⁴¹⁷: Revert the removal of add_stylesheet() API. It will be kept until the Sphinx 6.0 release
- #2068¹⁴¹⁸, add *intersphinx_disabled_reftypes* for disabling interphinx resolution of cross-references that do not have an explicit inventory specification. Specific types of cross-references can be disabled, e.g., std:doc or all cross-references in a specific domain, e.g., std:*.
- #9623¹⁴¹⁹: Allow to suppress "toctree contains reference to excluded document" warnings using suppress_warnings

- #9630¹⁴²⁰: autodoc: Failed to build cross references if *primary_domain* is not 'py'
- #9644¹⁴²¹: autodoc: Crashed on getting source info from problematic object
- #9655¹⁴²²: autodoc: mocked object having doc comment is warned unexpectedly
- #9651¹⁴²³: autodoc: return type field is not generated even if autodoc_typehints_description_target is set to "documented" when its info-field-list contains :returns: field
- #9657¹⁴²⁴: autodoc: The base class for a subclass of mocked object is incorrect

¹⁴¹¹ https://github.com/sphinx-doc/sphinx/issues/9639

¹⁴¹² https://github.com/sphinx-doc/sphinx/issues/9664

¹⁴¹³ https://github.com/sphinx-doc/sphinx/issues/9691

¹⁴¹⁴ https://github.com/sphinx-doc/sphinx/issues/9618

¹⁴¹⁵ https://github.com/sphinx-doc/sphinx/issues/9672

¹⁴¹⁶ https://github.com/sphinx-doc/sphinx/issues/9695

¹⁴¹⁷ https://github.com/sphinx-doc/sphinx/issues/9683

¹⁴¹⁸ https://github.com/sphinx-doc/sphinx/issues/2068

¹⁴¹⁹ https://github.com/sphinx-doc/sphinx/issues/9623

¹⁴²⁰ https://github.com/sphinx-doc/sphinx/issues/9630

¹⁴²¹ https://github.com/sphinx-doc/sphinx/issues/9644

¹⁴²² https://github.com/sphinx-doc/sphinx/issues/9655

¹⁴²³ https://github.com/sphinx-doc/sphinx/issues/9651

¹⁴²⁴ https://github.com/sphinx-doc/sphinx/issues/9657

- #9607¹⁴²⁵: autodoc: Incorrect base class detection for the subclasses of the generic class
- #9755¹⁴²⁶: autodoc: memory addresses are shown for aliases
- #9752¹⁴²⁷: autodoc: Failed to detect type annotation for slots attribute
- #9756¹⁴²⁸: autodoc: Crashed if classmethod does not have func attribute
- #9757¹⁴²⁹; autodoc: autodoc inherit docstrings does not effect to overridden classmethods
- #9781¹⁴³⁰: autodoc: autodoc_preserve_defaults does not support hexadecimal numeric
- #9630¹⁴³¹: autosummary: Failed to build summary table if *primary_domain* is not 'py'
- #9670¹⁴³²: html: Fix download file with special characters
- #9710¹⁴³³: html: Wrong styles for even/odd rows in nested tables
- #9763¹⁴³⁴: html: parameter name and its type annotation are not separated in HTML
- #9649¹⁴³⁵: HTML search: when objects have the same name but in different domains, return all of them as result instead of just one.
- #7634¹⁴³⁶: intersphinx: references on the file in sub directory are broken
- #9737¹⁴³⁷: LaTeX: hlist is rendered as a list containing "aggedright" text
- #9678¹⁴³⁸: linkcheck: file extension was shown twice in warnings
- #9697¹⁴³⁹: py domain: An index entry with parens was registered for py:method directive with :property: option
- #9775¹⁴⁴⁰: py domain: Literal typehint was converted cross reference to when autodoc_typehints='description'
- #9708¹⁴⁴¹: needs_extension failed to check double-digit version correctly
- #9688¹⁴⁴²: Fix Sphinx patched code¹⁴⁴³ does not recognize :class: option
- #9733¹⁴⁴⁴: Fix for logging handler flushing warnings in the middle of the docs build
- #9656¹⁴⁴⁵: Fix warnings without subtype being incorrectly suppressed
- Intersphinx, for unresolved references with an explicit inventory, e.g., proj:myFunc, leave the inventory prefix in the unresolved text.

14.38 Release 4.2.0 (released Sep 12, 2021)

Features added

- #9445¹⁴⁴⁶: autodoc: Support class properties
- #9479¹⁴⁴⁷: autodoc: Emit a warning if target is a mocked object
- #9560¹⁴⁴⁸: autodoc: Allow to refer NewType instances with module name in Python 3.10 or above
- #9447¹⁴⁴⁹: html theme: Expose the version of Sphinx in the form of tuple as a template variable sphinx_version_tuple
- #9594¹⁴⁵⁰: manpage: Suppress the title of man page if description is empty
- #9445¹⁴⁵¹: py domain: py:property directive supports :classmethod: option to describe the class property
- #9524¹⁴⁵²: test: SphinxTestApp can take builddir as an argument
- #9535¹⁴⁵³: C and C++, support more fundamental types, including GNU extensions.

- #9608¹⁴⁵⁴: apidoc: apidoc does not generate a module definition for implicit namespace package
- #9504¹⁴⁵⁵: autodoc: generate incorrect reference to the parent class if the target class inherites the class having _name attribute
- #9537¹⁴⁵⁶, #9589¹⁴⁵⁷: autodoc: Some objects under typing module are not displayed well with the HEAD of 3.10
- #9487¹⁴⁵⁸: autodoc: typehint for cached_property is not shown
- #9509¹⁴⁵⁹: autodoc: AttributeError is raised on failed resolving typehints
- #9518¹⁴⁶⁰: autodoc: autodoc_docstring_signature does not effect to __init__() and __new__()
- #9522¹⁴⁶¹: autodoc: PEP 585 style typehints having arguments (ex. list[int]) are not displayed well
- #9481¹⁴⁶²: autosummary: some warnings contain non-existing filenames
- #9568¹⁴⁶³: autosummary: summarise overlined sectioned headings correctly

¹⁴⁶² https://github.com/sphinx-doc/sphinx/issues/9481

¹⁴⁶³ https://github.com/sphinx-doc/sphinx/issues/9568

- #9600¹⁴⁶⁴: autosummary: Type annotations which contain commas in autosummary table are not removed completely
- #9481¹⁴⁶⁵: c domain: some warnings contain non-existing filenames
- #9481¹⁴⁶⁶: cpp domain: some warnings contain non-existing filenames
- #9456¹⁴⁶⁷: html search: abbreation marks are inserted to the search result if failed to fetch the content of the page
- #9617¹⁴⁶⁸: html search: The JS requirement warning is shown if browser is slow
- #9267¹⁴⁶⁹: html theme: CSS and JS files added by theme were loaded twice
- #9585¹⁴⁷⁰: py domain: :type: option for py:property directive does not create a hyperlink
- #9576¹⁴⁷¹: py domain: Literal typehint was converted to a cross reference
- #9535¹⁴⁷² comment: C++, fix parsing of defaulted function parameters that are function pointers.
- #9564¹⁴⁷³: smartquotes: don't adjust typography for text with language-highlighted : code: role.
- #9512¹⁴⁷⁴: sphinx-build: crashed with the HEAD of Python 3.10

14.39 Release 4.1.2 (released Jul 27, 2021)

Incompatible changes

• #9435¹⁴⁷⁵: linkcheck: Disable checking automatically generated anchors on github.com (ex. anchors in reST/Markdown documents)

- #9489¹⁴⁷⁶: autodoc: Custom types using typing. NewType are not displayed well with the HEAD of 3.10
- #9490¹⁴⁷⁷: autodoc: Some objects under typing module are not displayed well with the HEAD of 3.10
- #9436¹⁴⁷⁸, #9471¹⁴⁷⁹: autodoc: crashed if autodoc_class_signature = "separated"
- #9456¹⁴⁸⁰: html search: html copy source can't control the search summaries
- #9500¹⁴⁸¹: LaTeX: Failed to build Japanese document on Windows

• #9435¹⁴⁸²: linkcheck: Failed to check anchors in github.com

14.40 Release 4.1.1 (released Jul 15, 2021)

Dependencies

- #9434¹⁴⁸³: sphinxcontrib-htmlhelp-2.0.0 or above
- #9434¹⁴⁸⁴: sphinxcontrib-serializinghtml-1.1.5 or above

Bugs fixed

• #9438¹⁴⁸⁵: html: HTML logo or Favicon specified as file not being found on output

14.41 Release 4.1.0 (released Jul 12, 2021)

Dependencies

• Support jinja2-3.0

Deprecated

- The app argument of sphinx.environment.BuildEnvironment becomes required
- sphinx.application.Sphinx.html_theme
- sphinx.ext.autosummary._app
- sphinx.util.docstrings.extract_metadata()

- #8107¹⁴⁸⁶: autodoc: Add class-doc-from option to autoclass directive to control the content of the specific class like autoclass_content
- #8588¹⁴⁸⁷: autodoc: autodoc_type_aliases now supports dotted name. It allows you to define an alias for a class with module name like foo.bar.BazClass
- #9175¹⁴⁸⁸: autodoc: Special member is not documented in the module
- #9195¹⁴⁸⁹: autodoc: The arguments of typing.Literal are wrongly rendered

¹⁴⁸⁷ https://github.com/sphinx-doc/sphinx/issues/8588

¹⁴⁸⁸ https://github.com/sphinx-doc/sphinx/issues/9175

¹⁴⁸⁹ https://github.com/sphinx-doc/sphinx/issues/9195

- #9185¹⁴⁹⁰: autodoc: autodoc_typehints allows 'both' setting to allow typehints to be included both in the signature and description
- #4257¹⁴⁹¹: autodoc: Add autodoc_class_signature to separate the class entry and the definition of __init__() method
- #8061¹⁴⁹², #9218¹⁴⁹³: autodoc: Support variable comment for alias classes
- #3014¹⁴⁹⁴: autodoc: Add autodoc-process-bases to modify the base classes of the class definitions
- #9272¹⁴⁹⁵: autodoc: Render enum values for the default argument value better
- #9384¹⁴⁹⁶: autodoc: autodoc_typehints='none' now erases typehints for variables, attributes and properties
- #3257¹⁴⁹⁷: autosummary: Support instance attributes for classes
- #9358¹⁴⁹⁸: html: Add "heading" role to the toctree items
- #9225¹⁴⁹⁹: html: Add span tag to the return typehint of method/function
- #9129¹⁵⁰⁰: html search: Show search summaries when html_copy_source = False
- #9307¹⁵⁰¹: html search: Prevent corrections and completions in search field
- #9120¹⁵⁰²: html theme: Eliminate prompt characters of code-block from copyable text
- #9176¹⁵⁰³: i18n: Emit a debug message if message catalog file not found under locale_dirs
- #9414¹⁵⁰⁴: LaTeX: Add xeCJKVerbAddon to default fyset config for Chinese documents
- #9016¹⁵⁰⁵: linkcheck: Support checking anchors on github.com
- #9016¹⁵⁰⁶: linkcheck: Add a new event *linkcheck-process-uri* to modify URIs before checking hyperlinks
- #6525¹⁵⁰⁷: linkcheck: Add linkcheck_allowed_redirects to mark hyperlinks that are redirected to expected URLs as "working"
- #1874¹⁵⁰⁸: py domain: Support union types using | in info-field-list
- #9268¹⁵⁰⁹: py domain: python_use_unqualified_type_names supports type field in info-field-list
- #9097¹⁵¹⁰: Optimize the parallel build
- #9131¹⁵¹¹: Add *nitpick_ignore_regex* to ignore nitpicky warnings using regular expressions

¹⁵¹¹ https://github.com/sphinx-doc/sphinx/issues/9131

- #9174¹⁵¹²: Add Sphinx.set_html_assets_policy to tell extensions to include HTML assets in all the pages. Extensions can check this via Sphinx.registry.html assets policy
- C++, add support for
 - inline variables,
 - consteval functions,
 - constinit variables.
 - char8 t.
 - explicit(<constant expression>) specifier,
 - digit separators in literals, and
 - constraints in placeholder type specifiers, aka. adjective syntax (e.g., Sortable auto &v).
- C, add support for digit separators in literals.
- #9166¹⁵¹³: LaTeX: support containers in LaTeX output

- #8872¹⁵¹⁴: autodoc: stacked singledispatches are wrongly rendered
- #8597¹⁵¹⁵: autodoc: a docsting having metadata only should be treated as undocumented
- #9185¹⁵¹⁶: autodoc: typehints for overloaded functions and methods are inaccurate
- #9250¹⁵¹⁷: autodoc: The inherited method not having docstring is wrongly parsed
- #9283¹⁵¹⁸: autodoc: autoattribute directive failed to generate document for an attribute not having any comment
- #9364¹⁵¹⁹: autodoc: single element tuple on the default argument value is wrongly rendered
- #9362¹⁵²⁰: autodoc: AttributeError is raised on processing a subclass of Tuple[()]
- #9404¹⁵²¹: autodoc: TypeError is raised on processing dict-like object (not a class) via autoclass directive
- #9317¹⁵²²: html: Pushing left key causes visiting the next page at the first page
- #9381¹⁵²³: html: URL for html favicon and html log does not work
- #9270¹⁵²⁴: html theme: pyramid theme generates incorrect logo links
- #9217¹⁵²⁵: manpage: The name of manpage directory that is generated by man_make_section_directory is not correct
- #9350¹⁵²⁶: manpage: Fix font isn't reset after keyword at the top of samp role

```

¹⁵²⁵ https://github.com/sphinx-doc/sphinx/issues/9217

¹⁵²⁶ https://github.com/sphinx-doc/sphinx/issues/9350

- #9306¹⁵²⁷: Linkcheck reports broken link when remote server closes the connection on HEAD request
- #9280¹⁵²⁸: py domain: "exceptions" module is not displayed
- #9418¹⁵²⁹: py domain: a Callable annotation with no parameters (e.g. Callable[[], None]) will be rendered with a bracket missing (Callable[], None])
- #9319¹⁵³⁰: quickstart: Make sphinx-quickstart exit when conf.py already exists
- #9387¹⁵³¹: xml: XML Builder ignores custom visitors
- #9224¹⁵³²: :param: and :type: fields does not support a type containing whitespace (ex. Dict[str, str])
- #8945¹⁵³³: when transforming typed fields, call the specified role instead of making an single xref. For C and C++, use the expr role for typed fields.

14.42 Release 4.0.3 (released Jul 05, 2021)

Features added

- C, add C23 keywords _Decimal32, _Decimal64, and _Decimal128.
- #9354¹⁵³⁴: C, add c_extra_keywords to allow user-defined keywords during parsing.
- Revert the removal of sphinx.util:force_decode() to become some 3rd party extensions available again during 5.0

- #9330¹⁵³⁵: changeset domain: versionchanged with contents being a list will cause error during pdf build
- #9313¹⁵³⁶: LaTeX: complex table with merged cells broken since 4.0
- #9305¹⁵³⁷: LaTeX: backslash may cause Improper discretionary list pdf build error with Japanese engines
- #9354¹⁵³⁸: C, remove special macro names from the keyword list. See also c_extra_keywords.
- #9322¹⁵³⁹: KeyError is raised on PropagateDescDomain transform

¹⁵³⁹ https://github.com/sphinx-doc/sphinx/issues/9322

14.43 Release 4.0.2 (released May 20, 2021)

Dependencies

• #9216¹⁵⁴⁰: Support jinja2-3.0

Incompatible changes

- #9222¹⁵⁴¹: Update Underscore.js to 1.13.1
- #9217¹⁵⁴²: manpage: Stop creating a section directory on build manpage by default (see man_make_section_directory)

Bugs fixed

- #9210¹⁵⁴³: viewcode: crashed if non importable modules found on parallel build
- #9240¹⁵⁴⁴: Unknown node error for pending_xref_condition is raised if an extension that does not support the node installs a missing-reference handler

14.44 Release 4.0.1 (released May 11, 2021)

- #9189¹⁵⁴⁵: autodoc: crashed when ValueError is raised on generating signature from a property of the class
- #9188¹⁵⁴⁶: autosummary: warning is emitted if list value is set to autosummary generate
- #8380¹⁵⁴⁷: html search: tags for search result are broken
- #9198¹⁵⁴⁸: i18n: Babel emits errors when running compile_catalog
- #9205¹⁵⁴⁹: py domain: The :canonical: option causes "more than one target for cross-reference" warning
- #9201¹⁵⁵⁰: websupport: UndefinedError is raised: 'css_tag' is undefined

¹⁵⁴⁹ https://github.com/sphinx-doc/sphinx/issues/9205

¹⁵⁵⁰ https://github.com/sphinx-doc/sphinx/issues/9201

https://github.com/spinhx-doc/spinhx/issues/9201

14.45 Release 4.0.0 (released May 09, 2021)

Dependencies

4.0.0b1

- Drop python 3.5 support
- Drop Docutils 0.12 and 0.13 support
- LaTeX: add tex-gyre font dependency

4.0.0b2

• Support Docutils 0.17. Please notice it changes the output of HTML builder. Some themes do not support it, and you need to update your custom CSS to upgrade it.

Incompatible changes

- #8539¹⁵⁵¹: autodoc: info-field-list is generated into the class description when autodoc_typehints='description' and autoclass_content='class' set
- #8898¹⁵⁵²: extlinks: "%s" becomes required keyword in the link caption string
- domain: The Index class becomes subclasses of abc. ABC to indicate methods that must be overridden in the concrete classes
- #4826¹⁵⁵³: py domain: The structure of python objects is changed. A boolean value is added to indicate that the python object is canonical one
- #7425¹⁵⁵⁴: MathJax: The MathJax was changed from 2 to 3. Users using a custom MathJax configuration may have to set the old MathJax path or update their configuration for version 3. See *sphinx.ext.mathjax*.
- #7784¹⁵⁵⁵: i18n: The msgid for alt text of image is changed
- #5560¹⁵⁵⁶: napoleon: napoleon_use_param also affect "other parameters" section
- #7996¹⁵⁵⁷: manpage: Make a section directory on build manpage by default (see man_make_section_directory)
- #78401558: html: Change the default setting of html_codeblock_linenos_style to 'inline'
- #8380¹⁵⁵⁹: html search: search results are wrapped with instead of <div>
- html theme: Move a script tag for documentation_options.js in basic/layout.html to script_files variable
- html theme: Move CSS tags in basic/layout.html to css_files variable
- #8915¹⁵⁶⁰: html theme: Emit a warning for sphinx_rtd_theme 0.2.4 or older

¹⁵⁵¹ https://github.com/sphinx-doc/sphinx/issues/8539

¹⁵⁵² https://github.com/sphinx-doc/sphinx/issues/8898

¹⁵⁵³ https://github.com/sphinx-doc/sphinx/issues/4826

¹⁵⁵⁴ https://github.com/sphinx-doc/sphinx/issues/7425

¹⁵⁵⁵ https://github.com/sphinx-doc/sphinx/issues/7784

¹⁵⁵⁶ https://github.com/sphinx-doc/sphinx/issues/5560

¹⁵⁵⁷ https://github.com/sphinx-doc/sphinx/issues/7996

¹⁵⁵⁸ https://github.com/sphinx-doc/sphinx/issues/7849

https://github.com/sphinx-doc/sphinx/issues/8380

¹⁵⁶⁰ https://github.com/sphinx-doc/sphinx/issues/8915

- #8508¹⁵⁶¹: LaTeX: uplatex becomes a default setting of latex_engine for Japanese documents
- #5977¹⁵⁶²: py domain: :var:, :cvar: and :ivar: fields do not create cross-references
- #4550¹⁵⁶³: The align attribute of figure and table nodes becomes None by default instead of 'default'
- #8769¹⁵⁶⁴: LaTeX refactoring: split sphinx.sty into multiple files and rename some auxiliary files created in latex build output repertory
- #8937¹⁵⁶⁵: Use explicit title instead of <no title>
- #8487¹⁵⁶⁶: The :file: option for csv-table directive now recognizes an absolute path as a relative path from source directory

4.0.0b2

• #9023¹⁵⁶⁷: Change the CSS classes on *cpp:expr* and *cpp:texpr*.

Deprecated

- html_codeblock_linenos_style
- favicon and logo variable in HTML templates
- sphinx.directives.patches.CSVTable
- sphinx.directives.patches.ListTable
- sphinx.directives.patches.RSTTable
- sphinx.ext.autodoc.directive.DocumenterBridge.filename_set
- sphinx.ext.autodoc.directive.DocumenterBridge.warn()
- sphinx.registry.SphinxComponentRegistry.get_source_input()
- sphinx.registry.SphinxComponentRegistry.source_inputs
- sphinx.transforms.FigureAligner
- sphinx.util.pycompat.convert_with_2to3()
- sphinx.util.pycompat.execfile_()
- sphinx.util.smartypants
- sphinx.util.typing.DirectiveOption

¹⁵⁶⁵ https://github.com/sphinx-doc/sphinx/issues/8937

¹⁵⁶⁶ https://github.com/sphinx-doc/sphinx/issues/8487

¹⁵⁶⁷ https://github.com/sphinx-doc/sphinx/issues/9023

Features added

- #8924¹⁵⁶⁸: autodoc: Support bound argument for TypeVar
- #7383¹⁵⁶⁹: autodoc: Support typehints for properties
- #5603¹⁵⁷⁰: autodoc: Allow to refer to a python class using its canonical name when the class has two different names; a canonical name and an alias name
- #8539¹⁵⁷¹: autodoc: Add autodoc_typehints_description_target to control the behavior of autodoc_typehints=description
- #8841¹⁵⁷²: autodoc: autodoc_docstring_signature will continue to look for multiple signature lines without backslash character
- #7549¹⁵⁷³: autosummary: Enable autosummary_generate by default
- #8898¹⁵⁷⁴: extlinks: Allow %s in link caption string
- #4826¹⁵⁷⁵: py domain: Add :canonical: option to python directives to describe the location where the object is defined
- #7199¹⁵⁷⁶: py domain: Add *python_use_unqualified_type_names* to suppress the module name of the python reference if it can be resolved (experimental)
- #7068¹⁵⁷⁷: py domain: Add *py:property* directive to describe a property
- #7784¹⁵⁷⁸: i18n: The alt text for image is translated by default (without *gettext_additional_targets* setting)
- #2018¹⁵⁷⁹: html: html_favicon and html_logo now accept URL for the image
- #8070¹⁵⁸⁰: html search: Support searching for 2characters word
- #9036¹⁵⁸¹: html theme: Allow to inherite the search page
- #8938¹⁵⁸²: imgconverter: Show the error of the command availability check
- #7830¹⁵⁸³: Add debug logs for change detection of sources and templates
- #8201¹⁵⁸⁴: Emit a warning if toctree contains duplicated entries
- #8326¹⁵⁸⁵: master_doc is now renamed to *root_doc*
- #8942¹⁵⁸⁶: C++, add support for the C++20 spaceship operator, <=>.

• #7199¹⁵⁸⁷: A new node, sphinx.addnodes.pending_xref_condition has been added. It can be used to choose appropriate content of the reference by conditions.

4.0.0b2

- #8818¹⁵⁸⁸: autodoc: Super class having Any arguments causes nit-picky warning
- #9095¹⁵⁸⁹: autodoc: TypeError is raised on processing broken metaclass
- #9110¹⁵⁹⁰: autodoc: metadata of GenericAlias is not rendered as a reference in pv37+
- #9098¹⁵⁹¹: html: copy-range protection for doctests doesn't work in Safari
- #9103¹⁵⁹²: LaTeX: imgconverter: conversion runs even if not needed
- #8127¹⁵⁹³: py domain: Ellipsis in info-field-list causes nit-picky warning
- #9121¹⁵⁹⁴: py domain: duplicated warning is emitted when both canonical and its alias objects are defined on the document
- #9023¹⁵⁹⁵: More CSS classes on domain descriptions, see *Doctree node classes added by Sphinx* for details.
- #8195¹⁵⁹⁶: mathjax: Rename mathjax_config to mathjax2_config and add mathjax3_config

Bugs fixed

- #8917¹⁵⁹⁷: autodoc: Raises a warning if function has wrong __globals__ value
- #8415¹⁵⁹⁸: autodoc: a TypeVar imported from other module is not resolved (in Python 3.7 or above)
- #8992¹⁵⁹⁹: autodoc: Failed to resolve types.TracebackType type annotation
- #8905¹⁶⁰⁰: html: html_add_permalinks=None and html_add_permalinks="" are ignored
- #8380¹⁶⁰¹: html search: Paragraphs in search results are not identified as
- #8915¹⁶⁰²: html theme: The translation of sphinx_rtd_theme does not work
- #8342¹⁶⁰³: Emit a warning if a unknown domain is given for directive or role (ex. :unknown:doc:)
- #7241¹⁶⁰⁴: LaTeX: No wrapping for cpp:enumerator
- #8711¹⁶⁰⁵: LaTeX: backticks in code-blocks trigger latexpdf build warning (and font change) with late TeXLive 2019

¹⁶⁰⁵ https://github.com/sphinx-doc/sphinx/issues/8711

- #8253¹⁶⁰⁶: LaTeX: Figures with no size defined get overscaled (compared to images with size explicitly set in pixels) (fixed for 'pdflatex'/'lualatex' only)
- #8881¹⁶⁰⁷: LaTeX: The depth of bookmarks panel in PDF is not enough for navigation
- #8874¹⁶⁰⁸: LaTeX: the fix to two minor Pygments LaTeXFormatter output issues ignore Pygments style
- #8925¹⁶⁰⁹: LaTeX: 3.5.0 verbatimmaxunderfull setting does not work as expected
- #8980¹⁶¹⁰: LaTeX: missing line break in \pysigline
- #8995¹⁶¹¹: LaTeX: legacy \pysiglinewithargsret does not compute correctly available horizontal space and should use a ragged right style
- #9009¹⁶¹²: LaTeX: "release" value with underscore leads to invalid LaTeX
- #8911¹⁶¹³: C++: remove the longest matching prefix in cpp_index_common_prefix instead of the first that matches.
- C, properly reject function declarations when a keyword is used as parameter name.
- #8933¹⁶¹⁴: viewcode: Failed to create back-links on parallel build
- #8960¹⁶¹⁵: C and C++, fix rendering of (member) function pointer types in function parameter lists.
- C++, fix linking of names in array declarators, pointer to member (function) declarators, and in the argument to sizeof....
- C, fix linking of names in array declarators.

4.0.0b2

• C, C++, fix KeyError when an alias directive is the first C/C++ directive in a file with another C/C++ directive

4.0.0b3

• #9167¹⁶¹⁶: html: Failed to add CSS files to the specific page

14.46 Release 3.5.5 (in development)

14.47 Release 3.5.4 (released Apr 11, 2021)

Dependencies

• #9071¹⁶¹⁷: Restrict Docutils to 0.16

¹⁶⁰⁶ https://github.com/sphinx-doc/sphinx/issues/8253

¹⁶⁰⁷ https://github.com/sphinx-doc/sphinx/issues/8881

¹⁶¹⁶ https://github.com/sphinx-doc/sphinx/issues/9167

¹⁶¹⁷ https://github.com/sphinx-doc/sphinx/issues/9071

- #9078¹⁶¹⁸: autodoc: Async staticmethods and classmethods are considered as non async coroutine-functions with Python3.10
- $\#8870^{1619}$, $\#9001^{1620}$, $\#9051^{1621}$: html theme: The style are not applied with Docutils 0.17
 - toctree captions
 - The content of sidebar directive
 - figures

14.48 Release 3.5.3 (released Mar 20, 2021)

Features added

• #8959¹⁶²²: using UNIX path separator in image directive confuses Sphinx on Windows

14.49 Release 3.5.2 (released Mar 06, 2021)

Bugs fixed

- #8943¹⁶²³: i18n: Crashed by broken translation messages in ES, EL and HR
- #8936¹⁶²⁴: LaTeX: A custom LaTeX builder fails with unknown node error
- #8952¹⁶²⁵: Exceptions raised in a Directive cause parallel builds to hang

14.50 Release 3.5.1 (released Feb 16, 2021)

- #8883¹⁶²⁶: autodoc: AttributeError is raised on assigning annotations on read-only class
- #8884¹⁶²⁷: html: minified js stemmers not included in the distributed package
- #8885¹⁶²⁸: html: AttributeError is raised if CSS/JS files are installed via html_context
- #8880¹⁶²⁹: viewcode: ExtensionError is raised on incremental build after unparsable python module found

¹⁶²⁹ https://github.com/sphinx-doc/sphinx/issues/8880

14.51 Release 3.5.0 (released Feb 14, 2021)

Dependencies

• LaTeX: multicol (it is anyhow a required part of the official latex2e base distribution)

Incompatible changes

- Update Underscore.js to 1.12.0
- #6550¹⁶³⁰: html: The config variable html_add_permalinks is replaced by html_permalinks and html_permalinks_icon

Deprecated

- pending_xref node for viewcode extension
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.anchors_ignore
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.auth
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.broken
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.good
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.redirected
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.rqueue
- $\bullet \ \ sphinx.builders.linkcheck.Check External Links Builder.to_ignore$
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.workers
- sphinx.builders.linkcheck.CheckExternalLinksBuilder.wqueue
- sphinx.builders.linkcheck.node_line_or_0()
- sphinx.ext.autodoc.AttributeDocumenter.isinstanceattribute()
- sphinx.ext.autodoc.directive.DocumenterBridge.reporter
- sphinx.ext.autodoc.importer.get_module_members()
- sphinx.ext.autosummary.generate._simple_info()
- sphinx.ext.autosummary.generate._simple_warn()
- sphinx.writers.html.HTMLTranslator.permalink_text
- sphinx.writers.html5.HTML5Translator.permalink_text

¹⁶³⁰ https://github.com/sphinx-doc/sphinx/issues/6550

Features added

- #8022¹⁶³¹: autodoc: autodata and autoattribute directives does not show right-hand value of the variable if docstring contains :meta hide-value: in info-field-list
- #8514¹⁶³²: autodoc: Default values of overloaded functions are taken from actual implementation if they're ellipsis
- #8775¹⁶³³: autodoc: Support type union operator (PEP-604) in Python 3.10 or above
- #8297¹⁶³⁴: autodoc: Allow to extend autodoc_default_options via directive options
- #759¹⁶³⁵: autodoc: Add a new configuration *autodoc_preserve_defaults* as an experimental feature. It preserves the default argument values of functions in source code and keep them not evaluated for readability.
- #8619¹⁶³⁶: html: kbd role generates customizable HTML tags for compound keys
- #8634¹⁶³⁷: html: Allow to change the order of JS/CSS via priority parameter for *Sphinx.add_js_file()* and *Sphinx.add_css_file()*
- #6241¹⁶³⁸: html: Allow to add JS/CSS files to the specific page when an extension calls app.add_js_file() or app.add_css_file() on html-page-context event
- #6550¹⁶³⁹: html: Allow to use HTML permalink texts via html_permalinks_icon
- #1638¹⁶⁴⁰: html: Add permalink icons to glossary terms
- #8868¹⁶⁴¹: html search: performance issue with massive lists
- #8867¹⁶⁴²; html search: Update JavaScript stemmer code to the latest version of Snowball (v2.1.0)
- #8852¹⁶⁴³: i18n: Allow to translate heading syntax in MyST-Parser
- #8649¹⁶⁴⁴: imgconverter: Skip availability check if builder supports the image type
- #8573¹⁶⁴⁵: napoleon: Allow to change the style of custom sections using napoleon_custom_sections
- #8004¹⁶⁴⁶: napoleon: Type definitions in Google style docstrings are rendered as references when napoleon_preprocess_types enabled
- #6241¹⁶⁴⁷: mathjax: Include mathjax.js only on the document using equations
- #8775¹⁶⁴⁸: py domain: Support type union operator (PEP-604)
- #8651¹⁶⁴⁹: std domain: cross-reference for a rubric having inline item is broken

https://github.com/sphinx-doc/sphinx/issues/8241

¹⁶⁴⁹ https://github.com/sphinx-doc/sphinx/issues/8651

- #7642¹⁶⁵⁰: std domain: Optimize case-insensitive match of term
- #8681¹⁶⁵¹: viewcode: Support incremental build
- #8132¹⁶⁵²: Add project_copyright as an alias of copyright
- #207¹⁶⁵³: Now highlight_language supports multiple languages
- #2030¹⁶⁵⁴: code-block and literalinclude supports automatic dedent via no-argument :dedent; option
- C++, also hyperlink operator overloads in expressions and alias declarations.
- #8247¹⁶⁵⁵: Allow production lists to refer to tokens from other production groups
- #8813¹⁶⁵⁶: Show what extension (or module) caused it on errors on event handler
- #8213¹⁶⁵⁷: C++: add maxdepth option to *cpp:alias* to insert nested declarations.
- C, add noroot option to c:alias to render only nested declarations.
- C++, add noroot option to *cpp:alias* to render only nested declarations.

- #8727¹⁶⁵⁸: apidoc: namespace module file is not generated if no submodules there
- #741¹⁶⁵⁹: autodoc: inherited-members doesn't work for instance attributes on super class
- #8592¹⁶⁶⁰: autodoc: :meta public: does not effect to variables
- #8594¹⁶⁶¹: autodoc: empty __all__ attribute is ignored
- #8315¹⁶⁶²: autodoc: Failed to resolve struct. Struct type annotation
- #8652¹⁶⁶³: autodoc: All variable comments in the module are ignored if the module contains invalid type com-
- #8693¹⁶⁶⁴: autodoc: Default values for overloaded functions are rendered as string
- #8134¹⁶⁶⁵: autodoc: crashes when mocked decorator takes arguments
- #8800¹⁶⁶⁶: autodoc: Uninitialized attributes in superclass are recognized as undocumented
- #8655¹⁶⁶⁷: autodoc: Failed to generate document if target module contains an object that raises an exception on hasattr()
- #8306¹⁶⁶⁸: autosummary: mocked modules are documented as empty page when using :recursive: option

¹⁶⁶⁸ https://github.com/sphinx-doc/sphinx/issues/8306

- #8232¹⁶⁶⁹: graphviz: Image node is not rendered if graph file is in subdirectory
- #8618¹⁶⁷⁰: html: kbd role produces incorrect HTML when compound-key separators (-, + or ^) are used as keystrokes
- #8629¹⁶⁷¹: html: A type warning for html use opensearch is shown twice
- #8714¹⁶⁷²: html: kbd role with "Caps Lock" rendered incorrectly
- #8123¹⁶⁷³: html search: fix searching for terms containing + (Requires a custom search language that does not split on +)
- #8665¹⁶⁷⁴: html theme: Could not override globaltoc maxdepth in theme.conf
- #8446¹⁶⁷⁵: html: consecutive spaces are displayed as single space
- #8745¹⁶⁷⁶: i18n: crashes with KeyError when translation message adds a new auto footnote reference
- #4304¹⁶⁷⁷: linkcheck: Fix race condition that could lead to checking the availability of the same URL twice
- #8791¹⁶⁷⁸: linkcheck: The docname for each hyperlink is not displayed
- #7118¹⁶⁷⁹: sphinx-quickstart: questionare got Mojibake if libreadline unavailable
- #8094¹⁶⁸⁰: texinfo: image files on the different directory with document are not copied
- #8782¹⁶⁸¹: todo: Cross references in todolist get broken
- #8720¹⁶⁸²: viewcode: module pages are generated for epub on incremental build
- #8704¹⁶⁸³: viewcode: anchors are generated in incremental build after singlehtml
- #8756¹⁶⁸⁴: viewcode: highlighted code is generated even if not referenced
- #8671¹⁶⁸⁵: highlight_options is not working
- #8341¹⁶⁸⁶: C, fix intersphinx lookup types for names in declarations.
- C, C++: in general fix intersphinx and role lookup types.
- #8683¹⁶⁸⁷: html_last_updated_fmt does not support UTC offset (%z)
- #8683¹⁶⁸⁸: html_last_updated_fmt generates wrong time zone for %Z
- #1112¹⁶⁸⁹: download role creates duplicated copies when relative path is specified

¹⁶⁸⁸ https://github.com/sphinx-doc/sphinx/issues/8683

¹⁶⁸⁹ https://github.com/sphinx-doc/sphinx/issues/1112

- #2616¹⁶⁹⁰ (fifth item): LaTeX: footnotes from captions are not clickable, and for manually numbered footnotes only first one with same number is an hyperlink
- #7576¹⁶⁹¹: LaTeX with French babel and memoir crash: "Illegal parameter number in definition of \FNH@prefntext"
- #8055¹⁶⁹²: LaTeX (docs): A potential display bug with the LaTeX generation step in Sphinx (how to generate one-column index)
- #8072¹⁶⁹³: LaTeX: Directive *hlist* not implemented in LaTeX
- #8214¹⁶⁹⁴: LaTeX: The *index* role and the glossary generate duplicate entries in the LaTeX index (if both used for same term)
- #8735¹⁶⁹⁵: LaTeX: wrong internal links in pdf to captioned code-blocks when *numfig* is not True
- #8442¹⁶⁹⁶: LaTeX: some indexed terms are ignored when using xelatex engine (or pdflatex and latex_use_xindy set to True) with memoir class
- #8750¹⁶⁹⁷: LaTeX: URLs as footnotes fail to show in PDF if originating from inside function type signatures
- #8780¹⁶⁹⁸: LaTeX: long words in narrow columns may not be hyphenated
- #8788¹⁶⁹⁹: LaTeX: \titleformat last argument in sphinx.sty should be bracketed, not braced (and is anyhow not needed)
- #8849¹⁷⁰⁰: LaTex: code-block printed out of margin (see the opt-in LaTeX syntax boolean *verbatimforcewraps* for use via the *'sphinxsetup'* key of latex_elements)
- #8183¹⁷⁰¹: LaTeX: Remove substitution reference nodes from doctree only on LaTeX builds
- #8865¹⁷⁰²: LaTeX: Restructure the index nodes inside title nodes only on LaTeX builds
- #8796¹⁷⁰³: LaTeX: potentially critical low level TeX coding mistake has gone unnoticed so far
- C, c:alias skip symbols without explicit declarations instead of crashing.
- C, c:alias give a warning when the root symbol is not declared.
- C, expr role should start symbol lookup in the current scope.

14.52 Release 3.4.3 (released Jan 08, 2021)

Bugs fixed

• #8655¹⁷⁰⁴: autodoc: Failed to generate document if target module contains an object that raises an exception on hasattr()

14.53 Release 3.4.2 (released Jan 04, 2021)

Bugs fixed

- #8164¹⁷⁰⁵: autodoc: Classes that inherit mocked class are not documented
- #8602¹⁷⁰⁶: autodoc: The autodoc-process-docstring event is emitted to the non-datadescriptors unexpectedly
- #8616¹⁷⁰⁷: autodoc: AttributeError is raised on non-class object is passed to autoclass directive

14.54 Release 3.4.1 (released Dec 25, 2020)

- #8559¹⁷⁰⁸: autodoc: AttributeError is raised when using forward-reference type annotations
- #8568¹⁷⁰⁹: autodoc: TypeError is raised on checking slots attribute
- #8567¹⁷¹⁰: autodoc: Instance attributes are incorrectly added to Parent class
- #8566¹⁷¹¹: autodoc: The autodoc-process-docstring event is emitted to the alias classes unexpectedly
- #8583¹⁷¹²: autodoc: Unnecessary object comparison via __eq__ method
- #8565¹⁷¹³: linkcheck: Fix PriorityQueue crash when link tuples are not comparable

¹⁷¹³ https://github.com/sphinx-doc/sphinx/issues/8565

14.55 Release 3.4.0 (released Dec 20, 2020)

Incompatible changes

• #8105¹⁷¹⁴: autodoc: the signature of class constructor will be shown for decorated classes, not a signature of decorator

Deprecated

- The follow_wrapped argument of sphinx.util.inspect.signature()
- The no_docstring argument of sphinx.ext.autodoc.Documenter.add_content()
- sphinx.ext.autodoc.Documenter.get_object_members()
- sphinx.ext.autodoc.DataDeclarationDocumenter
- sphinx.ext.autodoc.GenericAliasDocumenter
- sphinx.ext.autodoc.InstanceAttributeDocumenter
- sphinx.ext.autodoc.SlotsAttributeDocumenter
- sphinx.ext.autodoc.TypeVarDocumenter
- sphinx.ext.autodoc.importer._getannotations()
- sphinx.ext.autodoc.importer._getmro()
- sphinx.pycode.ModuleAnalyzer.parse()
- sphinx.util.osutil.movefile()
- sphinx.util.requests.is_ssl_error()

Features added

- #8119¹⁷¹⁵: autodoc: Allow to determine whether a member not included in __all__ attribute of the module should be documented or not via autodoc-skip-member event
- #8219¹⁷¹⁶: autodoc: Parameters for generic class are not shown when super class is a generic class and show-inheritance option is given (in Python 3.7 or above)
- autodoc: Add Documenter.config as a shortcut to access the config object
- autodoc: Add Optional[t] to annotation of function and method if a default value equal to None is set.
- #8209¹⁷¹⁷: autodoc: Add :no-value: option to *autoattribute* and *autodata* directive to suppress the default value of the variable
- #8460¹⁷¹⁸: autodoc: Support custom types defined by typing.NewType
- #8285¹⁷¹⁹: napoleon: Add *napoleon_attr_annotations* to merge type hints on source code automatically if any type is specified in docstring

¹⁷¹⁴ https://github.com/sphinx-doc/sphinx/issues/8105

¹⁷¹⁵ https://github.com/sphinx-doc/sphinx/issues/8119

¹⁷¹⁶ https://github.com/sphinx-doc/sphinx/issues/8219

¹⁷¹⁷ https://github.com/sphinx-doc/sphinx/issues/8209

¹⁷¹⁸ https://github.com/sphinx-doc/sphinx/issues/8460

¹⁷¹⁹ https://github.com/sphinx-doc/sphinx/issues/8285

- #8236¹⁷²⁰: napoleon: Support numpydoc's "Receives" section
- #6914¹⁷²¹: Add a new event warn-missing-reference to custom warning messages when failed to resolve a cross-reference
- #6914¹⁷²²: Emit a detailed warning when failed to resolve a :ref: reference
- #6629¹⁷²³: linkcheck: The builder now handles rate limits. See *linkcheck_rate_limit_timeout* for details.

- #7613¹⁷²⁴: autodoc: autodoc does not respect __signature__ of the class
- #4606¹⁷²⁵: autodoc: the location of the warning is incorrect for inherited method
- #8105¹⁷²⁶: autodoc: the signature of class constructor is incorrect if the class is decorated
- #8434¹⁷²⁷: autodoc: autodoc_type_aliases does not effect to variables and attributes
- #8443¹⁷²⁸: autodoc: autodata directive can't create document for PEP-526 based type annotated variables
- #8443¹⁷²⁹: autodoc: autoattribute directive can't create document for PEP-526 based uninitialized variables
- #8480¹⁷³⁰: autodoc: autoattribute could not create document for slots attributes
- #8503¹⁷³¹: autodoc: autoattribute could not create document for a GenericAlias as class attributes correctly
- #8534¹⁷³²: autodoc: autoattribute could not create document for a commented attribute in alias class
- #8452¹⁷³³: autodoc: autodoc type aliases doesn't work when autodoc typehints is set to "description"
- #8541¹⁷³⁴: autodoc: autodoc_type_aliases doesn't work for the type annotation to instance attributes
- #8460¹⁷³⁵: autodoc: autodata and autoattribute directives do not display type information of TypeVars
- #8493¹⁷³⁶: autodoc: references to builtins not working in class aliases
- #8522¹⁷³⁷: autodoc: __bool__ method could be called
- #8067¹⁷³⁸: autodoc: A typehint for the instance variable having type_comment on super class is not displayed
- #8545¹⁷³⁹: autodoc: a slots attribute is not documented even having docstring
- #741¹⁷⁴⁰: autodoc: inherited-members doesn't work for instance attributes on super class

- #8477¹⁷⁴¹: autosummary: non utf-8 reST files are generated when template contains multibyte characters
- #8501¹⁷⁴²: autosummary: summary extraction splits text after "el at." unexpectedly
- #8524¹⁷⁴³: html: Wrong url_root has been generated on a document named "index"
- #8419¹⁷⁴⁴: html search: Do not load language_data.js in non-search pages
- #8549¹⁷⁴⁵: i18n: -D gettext_compact=0 is no longer working
- #8454¹⁷⁴⁶: graphviz: The layout option for graph and digraph directives don't work
- #8131¹⁷⁴⁷: linkcheck: Use GET when HEAD requests cause Too Many Redirects, to accommodate infinite redirect loops on HEAD
- #8437¹⁷⁴⁸: Makefile: make clean with empty BUILDDIR is dangerous
- #8365¹⁷⁴⁹: py domain: :type: and :rtype: gives false ambiguous class lookup warnings
- #8352¹⁷⁵⁰: std domain: Failed to parse an option that starts with bracket
- #8519¹⁷⁵¹: LaTeX: Prevent page brake in the middle of a seealso
- #8520¹⁷⁵²: C, fix copying of AliasNode.

14.56 Release 3.3.1 (released Nov 12, 2020)

- #8372¹⁷⁵³: autodoc: autoclass directive became slower than Sphinx 3.2
- #7727¹⁷⁵⁴: autosummary: raise PycodeError when documenting python package without __init__.py
- #8350¹⁷⁵⁵: autosummary: autosummary_mock_imports causes slow down builds
- #8364¹⁷⁵⁶: C, properly initialize attributes in empty symbols.
- #8399¹⁷⁵⁷: i18n: Put system locale path after the paths specified by configuration

14.57 Release 3.3.0 (released Nov 02, 2020)

Deprecated

- sphinx.builders.latex.LaTeXBuilder.usepackages
- sphinx.builders.latex.LaTeXBuilder.usepackages_afger_hyperref
- sphinx.ext.autodoc.SingledispatchFunctionDocumenter
- sphinx.ext.autodoc.SingledispatchMethodDocumenter

Features added

- #8100¹⁷⁵⁸: html: Show a better error message for failures on copying html static files
- #8141¹⁷⁵⁹: C: added a maxdepth option to *c:alias* to insert nested declarations.
- #8081¹⁷⁶⁰: LaTeX: Allow to add LaTeX package via app.add_latex_package() until just before writing .tex file
- #7996¹⁷⁶¹: manpage: Add man_make_section_directory to make a section directory on build man page
- #8289¹⁷⁶²: epub: Allow to suppress "duplicated ToC entry found" warnings from epub builder using *suppress_warnings*.
- #8298¹⁷⁶³: sphinx-quickstart: Add sphinx-quickstart --no-sep option
- #8304¹⁷⁶⁴: sphinx.testing: Register public markers in sphinx.testing.fixtures
- #8051¹⁷⁶⁵: napoleon: use the obj role for all See Also items
- #8050¹⁷⁶⁶: napoleon: Apply napoleon_preprocess_types to every field
- C and C++, show line numbers for previous declarations when duplicates are detected.
- #8183¹⁷⁶⁷: Remove substitution_reference nodes from doctree only on LaTeX builds

- #8085¹⁷⁶⁸: i18n: Add support for having single text domain
- #6640¹⁷⁶⁹: i18n: Failed to override system message translation
- #8143¹⁷⁷⁰: autodoc: AttributeError is raised when False value is passed to autodoc_default_options
- #8103¹⁷⁷¹: autodoc: functools.cached property is not considered as a property

¹⁷⁷¹ https://github.com/sphinx-doc/sphinx/issues/8103

- #8190¹⁷⁷²: autodoc: parsing error is raised if some extension replaces docstring by string not ending with blank lines
- #8142¹⁷⁷³: autodoc: Wrong constructor signature for the class derived from typing.Generic
- #8157¹⁷⁷⁴: autodoc: TypeError is raised when annotation has invalid args
- #7964¹⁷⁷⁵: autodoc: Tuple in default value is wrongly rendered
- #8200¹⁷⁷⁶: autodoc: type aliases break type formatting of autoattribute
- #7786¹⁷⁷⁷: autodoc: can't detect overloaded methods defined in other file
- #8294¹⁷⁷⁸: autodoc: single-string slots is not handled correctly
- #7785¹⁷⁷⁹: autodoc: autodoc typehints='none' does not effect to overloaded functions
- #8192¹⁷⁸⁰: napoleon: description is disappeared when it contains inline literals
- #8142¹⁷⁸¹: napoleon: Potential of regex denial of service in google style docs
- #8169¹⁷⁸²: LaTeX: pxjahyper loaded even when latex_engine is not platex
- #8215¹⁷⁸³: LaTeX: 'oneside' classoption causes build warning
- #8175¹⁷⁸⁴: intersphinx: Potential of regex denial of service by broken inventory
- #8277¹⁷⁸⁵: sphinx-build: missing and redundant spacing (and etc) for console output on building
- #7973¹⁷⁸⁶: imgconverter: Check availability of imagemagick many times
- #8255¹⁷⁸⁷: py domain: number in default argument value is changed from hexadecimal to decimal
- #8316¹⁷⁸⁸: html: Prevent arrow keys changing page when button elements are focused
- #8343¹⁷⁸⁹: html search: Fix unnecessary load of images when parsing the document
- #8254¹⁷⁹⁰: html theme: Line numbers misalign with code lines
- #8093¹⁷⁹¹: The highlight warning has wrong location in some builders (LaTeX, singlehtml and so on)
- #8215¹⁷⁹²: Eliminate Fancyhdr build warnings for oneside documents
- #8239¹⁷⁹³: Failed to refer a token in productionlist if it is indented
- #8268¹⁷⁹⁴: linkcheck: Report HTTP errors when linkcheck_anchors is True

¹⁷⁹⁴ https://github.com/sphinx-doc/sphinx/issues/8268

- #8245¹⁷⁹⁵: linkcheck: take source directory into account for local files
- #8321¹⁷⁹⁶: linkcheck: tel: schema hyperlinks are detected as errors
- #8323¹⁷⁹⁷: linkcheck: An exit status is incorrect when links having unsupported schema found
- #8188¹⁷⁹⁸: C, add missing items to internal object types dictionary, e.g., preventing intersphinx from resolving them.
- C, fix anon objects in intersphinx.
- #8270¹⁷⁹⁹, C++, properly reject functions as duplicate declarations if a non-function declaration of the same name already exists.
- C, fix references to function parameters. Link to the function instead of a non-existing anchor.
- #6914¹⁸⁰⁰: figure numbers are unexpectedly assigned to uncaptioned items
- #8320¹⁸⁰¹: make "inline" line numbers un-selectable

Testing

• #8257¹⁸⁰²: Support parallel build in sphinx.testing

14.58 Release 3.2.1 (released Aug 14, 2020)

Features added

- #8095¹⁸⁰³: napoleon: Add *napoleon_preprocess_types* to enable the type preprocessor for numpy style docstrings
- #8114¹⁸⁰⁴: C and C++, parse function attributes after parameters and qualifiers.

- #8074¹⁸⁰⁵: napoleon: Crashes during processing C-ext module
- #8088¹⁸⁰⁶: napoleon: "Inline literal start-string without end-string" warning in Numpy style Parameters section
- #8084¹⁸⁰⁷: autodoc: KeyError is raised on documenting an attribute of the broken class
- #8091¹⁸⁰⁸: autodoc: AttributeError is raised on documenting an attribute on Python 3.5.2
- #8099¹⁸⁰⁹: autodoc: NameError is raised when target code uses TYPE_CHECKING

¹⁸⁰⁹ https://github.com/sphinx-doc/sphinx/issues/8099

• C++, fix parsing of template template parameters, broken by the fix of #7944¹⁸¹⁰

14.59 Release 3.2.0 (released Aug 08, 2020)

Deprecated

- sphinx.ext.autodoc.members_set_option()
- sphinx.ext.autodoc.merge_special_members_option()
- sphinx.writers.texinfo.TexinfoWriter.desc
- C, parsing of pre-v3 style type directives and roles, along with the options c_allow_pre_v3 and c_warn_on_allowed_pre_v3.

Features added

- #2076¹⁸¹¹: autodoc: Allow overriding of exclude-members in skip-member function
- #8034¹⁸¹²: autodoc: :private-member: can take an explicit list of member names to be documented
- #2024¹⁸¹³: autosummary: Add autosummary_filename_map to avoid conflict of filenames between two object with different case
- #8011¹⁸¹⁴: autosummary: Support instance attributes as a target of autosummary directive
- #7849¹⁸¹⁵: html: Add html_codeblock_linenos_style to change the style of line numbers for code-blocks
- #7853¹⁸¹⁶: C and C++, support parameterized GNU style attributes.
- #7888¹⁸¹⁷: napoleon: Add aliases Warn and Raise.
- #7690¹⁸¹⁸: napoleon: parse type strings and make them hyperlinks as possible. The conversion rule can be updated via napoleon_type_aliases
- #8049¹⁸¹⁹: napoleon: Create a hyperlink for each the type of parameter when napoleon_use_param is False
- C, added c:alias directive for inserting copies of existing declarations.
- #7745¹⁸²⁰: html: inventory is broken if the docname contains a space
- #7991¹⁸²¹: html search: Allow searching for numbers
- #7902¹⁸²²: html theme: Add a new option globaltoc_maxdepth to control the behavior of globaltoc in sidebar
- #7840¹⁸²³: i18n: Optimize the dependencies check on bootstrap

 ¹⁸²² https://github.com/sphinx-doc/sphinx/issues/7902
 1823 https://github.com/sphinx-doc/sphinx/issues/7840

- #7768¹⁸²⁴: i18n: figure_language_filename supports docpath token
- #5208¹⁸²⁵: linkcheck: Support checks for local links
- #5090¹⁸²⁶: setuptools: Link verbosity to distutils' -v and -q option
- #6698¹⁸²⁷: doctest: Add :trim-doctest-flags: and :no-trim-doctest-flags: options to doctest, testcode and testoutput directives
- #7052¹⁸²⁸: add:noindexentry: to the Python, C, C++, and Javascript domains. Update the documentation to better reflect the relationship between this option and the :noindex: option.
- #7899¹⁸²⁹: C, add possibility of parsing of some pre-v3 style type directives and roles and try to convert them to equivalent v3 directives/roles. Set the new option c_allow_pre_v3 to True to enable this. The warnings printed from this functionality can be suppressed by setting c_warn_on_allowed_pre_v3 to True. The functionality is immediately deprecated.
- #7999¹⁸³⁰: C, add support for named variadic macro arguments.
- #8071¹⁸³¹: Allow to suppress "self referenced toctrees" warning

- #7886¹⁸³²: autodoc: TypeError is raised on mocking generic-typed classes
- #7935¹⁸³³: autodoc: function signature is not shown when the function has a parameter having inspect._empty as its default value
- #7901¹⁸³⁴: autodoc: type annotations for overloaded functions are not resolved
- #904¹⁸³⁵: autodoc: An instance attribute cause a crash of autofunction directive
- #1362¹⁸³⁶: autodoc: private-members option does not work for class attributes
- #7983¹⁸³⁷: autodoc: Generator type annotation is wrongly rendered in pv36
- #8030¹⁸³⁸: An uninitialized annotated instance variable is not documented when autodoc: :inherited-members: option given
- #8032¹⁸³⁹: autodoc: A type hint for the instance variable defined at parent class is not shown in the document of the derived class
- #80411840: autodoc: An annotated instance variable on super class is not documented when derived class has other annotated instance variables
- #7839¹⁸⁴¹: autosummary: cannot handle umlauts in function names

```

¹⁸⁴⁰ https://github.com/sphinx-doc/sphinx/issues/8041

¹⁸⁴¹ https://github.com/sphinx-doc/sphinx/issues/7839

- #7865¹⁸⁴²: autosummary: Failed to extract summary line when abbreviations found
- #7866¹⁸⁴³: autosummary: Failed to extract correct summary line when docstring contains a hyperlink target
- #7469¹⁸⁴⁴: autosummary: "Module attributes" header is not translatable
- #7940¹⁸⁴⁵: apidoc: An extra newline is generated at the end of the rst file if a module has submodules
- #4258¹⁸⁴⁶: napoleon: decorated special methods are not shown
- #7799¹⁸⁴⁷: napoleon: parameters are not escaped for combined params in numpydoc
- #7780¹⁸⁴⁸: napoleon: multiple parameters declaration in numpydoc was wrongly recognized when napoleon_use_param=True
- #7715¹⁸⁴⁹: LaTeX: numfig_secnum_depth > 1 leads to wrong figure links
- #7846¹⁸⁵⁰: html theme: XML-invalid files were generated
- #7894¹⁸⁵¹: gettext: Wrong source info is shown when using rst_epilog
- #7691¹⁸⁵²: linkcheck: HEAD requests are not used for checking
- #4888¹⁸⁵³: i18n: Failed to add an explicit title to :ref: role on translation
- #7928¹⁸⁵⁴: py domain: failed to resolve a type annotation for the attribute
- #8008¹⁸⁵⁵: py domain: failed to parse a type annotation containing ellipsis
- #7994¹⁸⁵⁶: std domain: option directive does not generate old node id compatible with 2.x or older
- #7968¹⁸⁵⁷: i18n: The content of math directive is interpreted as reST on translation
- #7768¹⁸⁵⁸: i18n: The root element for *figure_language_filename* is not a path that user specifies in the document
- #7993¹⁸⁵⁹: texinfo: TypeError is raised for nested object descriptions
- #7993¹⁸⁶⁰: texinfo: a warning not supporting desc signature line node is shown
- #7869¹⁸⁶¹: abbr role without an explanation will show the explanation from the previous abbr role
- #8048¹⁸⁶²: graphviz: graphviz.css was copied on building non-HTML document
- C and C++, removed noindex directive option as it did nothing.

¹⁸⁶² https://github.com/sphinx-doc/sphinx/issues/8048

- #7619¹⁸⁶³: Duplicated node IDs are generated if node has multiple IDs
- #2050¹⁸⁶⁴: Symbols sections are appeared twice in the index page
- #8017¹⁸⁶⁵: Fix circular import in sphinx.addnodes
- #7986¹⁸⁶⁶: CSS: make "highlight" selector more robust
- #7944¹⁸⁶⁷: C++, parse non-type template parameters starting with a dependent qualified name.
- C, don't deepcopy the entire symbol table and make a mess every time an enumerator is handled.

14.60 Release 3.1.2 (released Jul 05, 2020)

Incompatible changes

• #7650¹⁸⁶⁸: autodoc: the signature of base function will be shown for decorated functions, not a signature of decorator

- #7844¹⁸⁶⁹: autodoc: Failed to detect module when relative module name given
- #7856¹⁸⁷⁰: autodoc: AttributeError is raised when non-class object is given to the autoclass directive
- #7850¹⁸⁷¹: autodoc: KeyError is raised for invalid mark up when autodoc_typehints is 'description'
- #7812¹⁸⁷²: autodoc: crashed if the target name matches to both an attribute and module that are same name
- #7650¹⁸⁷³: autodoc: function signature becomes (*args, **kwargs) if the function is decorated by generic decorator
- #7812¹⁸⁷⁴: autosummary: generates broken stub files if the target code contains an attribute and module that are same name
- #7806¹⁸⁷⁵: viewcode: Failed to resolve viewcode references on 3rd party builders
- #7838¹⁸⁷⁶: html theme: List items have extra vertical space
- #7878¹⁸⁷⁷: html theme: Undesired interaction between "overflow" and "float"

¹⁸⁷⁷ https://github.com/sphinx-doc/sphinx/issues/7878

14.61 Release 3.1.1 (released Jun 14, 2020)

Incompatible changes

• #7808¹⁸⁷⁸: napoleon: a type for attribute are represented as typed field

Features added

• #7807¹⁸⁷⁹: autodoc: Show detailed warning when type_comment is mismatched with its signature

Bugs fixed

- #7808¹⁸⁸⁰: autodoc: Warnings raised on variable and attribute type annotations
- #7802¹⁸⁸¹: autodoc: EOFError is raised on parallel build
- #7821¹⁸⁸²: autodoc: TypeError is raised for overloaded C-ext function
- #7805¹⁸⁸³: autodoc: an object which descriptors returns is unexpectedly documented
- #7807¹⁸⁸⁴: autodoc: wrong signature is shown for the function using contextmanager
- #7812¹⁸⁸⁵: autosummary: generates broken stub files if the target code contains an attribute and module that are same name
- #7808¹⁸⁸⁶: napoleon: Warnings raised on variable and attribute type annotations
- #7811¹⁸⁸⁷: sphinx.util.inspect causes circular import problem

14.62 Release 3.1.0 (released Jun 08, 2020)

Dependencies

• #7746¹⁸⁸⁸: mathjax: Update to 2.7.5

¹⁸⁸⁷ https://github.com/sphinx-doc/sphinx/issues/7811

¹⁸⁸⁸ https://github.com/sphinx-doc/sphinx/issues/7746

Incompatible changes

• #7477¹⁸⁸⁹: imgconverter: Invoke "magick convert" command by default on Windows

Deprecated

- The first argument for sphinx.ext.autosummary.generate.AutosummaryRenderer has been changed to Sphinx object
- sphinx.ext.autosummary.generate.AutosummaryRenderer takes an object type as an argument
- The ignore argument of sphinx.ext.autodoc.Documenter.get_doc()
- The template_dir argument of sphinx.ext.autosummary.generate. AutosummaryRenderer
- The module argument of sphinx.ext.autosummary.generate. find_autosummary_in_docstring()
- The builder argument of sphinx.ext.autosummary.generate.generate_autosummary_docs()
- The template_dir argument of sphinx.ext.autosummary.generate.generate_autosummary_docs()
- The ignore argument of sphinx.util.docstring.prepare_docstring()
- sphinx.ext.autosummary.generate.AutosummaryRenderer.exists()
- sphinx.util.rpartition()

Features added

- LaTeX: Make the toplevel_sectioning setting optional in LaTeX theme
- LaTeX: Allow to override papersize and pointsize from LaTeX themes
- LaTeX: Add latex_theme_options to override theme options
- #7410¹⁸⁹⁰: Allow to suppress "circular toctree references detected" warnings using suppress_warnings
- C, added scope control directives, c:namespace, c:namespace-push, and c:namespace-pop.
- #2044¹⁸⁹¹: autodoc: Suppress default value for instance attributes
- #7473¹⁸⁹²: autodoc: consider a member public if docstring contains :meta public: in info-field-list
- #7487¹⁸⁹³: autodoc: Allow to generate docs for singledispatch functions by py:autofunction
- #7143¹⁸⁹⁴: autodoc: Support final classes and methods
- #7384¹⁸⁹⁵: autodoc: Support signatures defined by __new__(), metaclasses and builtin base classes
- #2106¹⁸⁹⁶: autodoc: Support multiple signatures on docstring
- #4422¹⁸⁹⁷: autodoc: Support GenericAlias in Python 3.7 or above

¹⁸⁹⁶ https://github.com/sphinx-doc/sphinx/issues/2106

¹⁸⁹⁷ https://github.com/sphinx-doc/sphinx/issues/4422

- #3610¹⁸⁹⁸: autodoc: Support overloaded functions
- #7722¹⁸⁹⁹: autodoc: Support TypeVar
- #7466¹⁹⁰⁰: autosummary: headings in generated documents are not translated
- #7490¹⁹⁰¹: autosummary: Add :caption: option to autosummary directive to set a caption to the toctree
- #7469¹⁹⁰²: autosummary: Support module attributes
- #248¹⁹⁰³, #6040¹⁹⁰⁴: autosummary: Add :recursive: option to autosummary directive to generate stub files recursively
- #4030¹⁹⁰⁵: autosummary: Add autosummary_context to add template variables for custom templates
- #7530¹⁹⁰⁶: html: Support nested <kbd> elements
- #7481¹⁹⁰⁷: html theme: Add right margin to footnote/citation labels
- #7482¹⁹⁰⁸, #7717¹⁹⁰⁹: html theme: CSS spacing for code blocks with captions and line numbers
- #7443¹⁹¹⁰: html theme: Add new options globaltoc_collapse and globaltoc_includehidden to control the behavior of globaltoc in sidebar
- #7484¹⁹¹¹: html theme: Avoid clashes between sidebar and other blocks
- #7476¹⁹¹²: html theme: Relbar breadcrumb should contain current page
- #7506¹⁹¹³: html theme: A canonical URL is not escaped
- #7533¹⁹¹⁴: html theme: Avoid whitespace at the beginning of genindex.html
- #7541¹⁹¹⁵: html theme: Add a "clearer" at the end of the "body"
- #7542¹⁹¹⁶: html theme: Make admonition/topic/sidebar scrollable
- #7543¹⁹¹⁷: html theme: Add top and bottom margins to tables
- #7695¹⁹¹⁸: html theme: Add viewport meta tag for basic theme
- #7721¹⁹¹⁹: html theme: classic: default codetextcolor/codebgcolor doesn't override Pygments
- C and C++: allow semicolon in the end of declarations.
- C++, parse parameterized noexcept specifiers.

- 1919 https://github.com/sphinx-doc/sphinx/issues/7721

- #7294¹⁹²⁰: C++, parse expressions with user-defined literals.
- C++, parse trailing return types.
- #7143¹⁹²¹: py domain: Add:final: option to py:class, py:exception and py:method directives
- #7596¹⁹²²: py domain: Change a type annotation for variables to a hyperlink
- #7770¹⁹²³: std domain: option directive support arguments in the form of foo[=bar]
- #7582¹⁹²⁴: napoleon: a type for attribute are represented like type annotation
- #7734¹⁹²⁵: napoleon: overescaped trailing underscore on attribute
- #7247¹⁹²⁶: linkcheck: Add *linkcheck_request_headers* to send custom HTTP headers for specific host
- #7792¹⁹²⁷: setuptools: Support --verbosity option
- #7683¹⁹²⁸: Add allowed_exceptions parameter to Sphinx.emit() to allow handlers to raise specified exceptions
- #7295¹⁹²⁹: C++, parse (trailing) requires clauses.

- #6703¹⁹³⁰: autodoc: incremental build does not work for imported objects
- #7564¹⁹³¹: autodoc: annotations not to be shown for descriptors
- #6588¹⁹³²: autodoc: Decorated inherited method has no documentation
- #7469¹⁹³³: autodoc: The change of autodoc-process-docstring for variables is cached unexpectedly
- #7559¹⁹³⁴: autodoc: misdetects a sync function is async
- #6857¹⁹³⁵: autodoc: failed to detect a classmethod on Enum class
- #7562¹⁹³⁶: autodoc: a typehint contains spaces is wrongly rendered under autodoc_typehints='description' mode
- #7551¹⁹³⁷: autodoc: failed to import nested class
- #7362¹⁹³⁸: autodoc: does not render correct signatures for built-in functions
- #7654¹⁹³⁹: autodoc: Optional[Union[foo, bar]] is presented as Union[foo, bar, None]

1939 https://github.com/sphinx-doc/sphinx/issues/7654
```

- #7629¹⁹⁴⁰: autodoc: autofunction emits an unfriendly warning if an invalid object specified
- #7650¹⁹⁴¹: autodoc: undecorated signature is shown for decorated functions
- #7676¹⁹⁴²: autodoc: typo in the default value of autodoc member order
- #7676¹⁹⁴³: autodoc: wrong value for :member-order: option is ignored silently
- #7676¹⁹⁴⁴: autodoc: member-order="bysource" does not work for C module
- #3673¹⁹⁴⁵: autodoc: member-order="bysource" does not work for a module having __all__
- #7668¹⁹⁴⁶: autodoc: wrong retann value is passed to a handler of autodoc-process-signature
- #7711¹⁹⁴⁷: autodoc: fails with ValueError when processing numpy objects
- #7791¹⁹⁴⁸: autodoc: TypeError is raised on documenting singledispatch function
- #7551¹⁹⁴⁹: autosummary: a nested class is indexed as non-nested class
- #7661¹⁹⁵⁰: autosummary: autosummary directive emits warnings twices if failed to import the target module
- The template variable "members" contains imported members even if autosummary: autossummary_imported_members is False
- #7671¹⁹⁵²: autosummary: The location of import failure warning is missing
- #7535¹⁹⁵³: sphinx-autogen: crashes when custom template uses inheritance
- #7536¹⁹⁵⁴: sphinx-autogen: crashes when template uses i18n feature
- #7781¹⁹⁵⁵: sphinx-build: Wrong error message when outdir is not directory
- #7653¹⁹⁵⁶: sphinx-quickstart: Fix multiple directory creation for nested relpath
- #2785¹⁹⁵⁷: html: Bad alignment of equation links
- #7718¹⁹⁵⁸: html theme: some themes does not respect background color of Pygments style (agogo, haiku, nature, pyramid, scrolls, sphinxdoc and traditional)
- #7544¹⁹⁵⁹: html theme: inconsistent padding in admonitions
- #7581¹⁹⁶⁰: napoleon: bad parsing of inline code in attribute docstrings
- #7628¹⁹⁶¹: imgconverter: runs imagemagick once unnecessary for builders not supporting images

¹⁹⁶¹ https://github.com/sphinx-doc/sphinx/issues/7628

- #7610¹⁹⁶²: incorrectly renders consecutive backslashes for Docutils 0.16
- #7646¹⁹⁶³: handle errors on event handlers
- #4187¹⁹⁶⁴: LaTeX: EN DASH disappears from PDF bookmarks in Japanese documents
- #7701¹⁹⁶⁵: LaTeX: Anonymous indirect hyperlink target causes duplicated labels
- #7723¹⁹⁶⁶: LaTeX: pdflatex crashed when URL contains a single quote
- #7756¹⁹⁶⁷: py domain: The default value for positional only argument is not shown
- #7760¹⁹⁶⁸: coverage: Add coverage_show_missing_items to show coverage result to console
- C++, fix rendering and xrefs in nested names explicitly starting in global scope, e.g., ::A::B.
- C, fix rendering and xrefs in nested names explicitly starting in global scope, e.g., .A.B.
- #7763¹⁹⁶⁹: C and C++, don't crash during display stringification of unary expressions and fold expressions.

14.63 Release 3.0.4 (released May 27, 2020)

Bugs fixed

- #7567¹⁹⁷⁰: autodoc: parametrized types are shown twice for generic types
- #7637¹⁹⁷¹: autodoc: system defined TypeVars are shown in Python 3.9
- #7696¹⁹⁷²: html: Updated jQuery version from 3.4.1 to 3.5.1 for security reasons
- #7611¹⁹⁷³: md5 fails when OpenSSL FIPS is enabled
- #7626¹⁹⁷⁴: release package does not contain CODE_OF_CONDUCT

14.64 Release 3.0.3 (released Apr 26, 2020)

Features added

• C, parse array declarators with static, qualifiers, and VLA specification.

```

¹⁹⁷⁴ https://github.com/sphinx-doc/sphinx/issues/7626

• #7516¹⁹⁷⁵: autodoc: crashes if target object raises an error on accessing its attributes

14.65 Release 3.0.2 (released Apr 19, 2020)

Features added

• C, parse attributes and add c_id_attributes and c_paren_attributes to support user-defined attributes.

Bugs fixed

- #7461¹⁹⁷⁶: py domain: fails with IndexError for empty tuple in type annotation
- #7510¹⁹⁷⁷: py domain: keyword-only arguments are documented as having a default of None
- #7418¹⁹⁷⁸: std domain: term role could not match case-insensitively
- #7461¹⁹⁷⁹: autodoc: empty tuple in type annotation is not shown correctly
- #7479¹⁹⁸⁰: autodoc: Sphinx builds has been slower since 3.0.0 on mocking
- C++, fix spacing issue in east-const declarations.
- #7414¹⁹⁸¹: LaTeX: Xindy language options were incorrect
- Sphinx crashes with ImportError on python3.5.1

14.66 Release 3.0.1 (released Apr 11, 2020)

Incompatible changes

• #7418¹⁹⁸²: std domain: term role becomes case sensitive

- #7428¹⁹⁸³: py domain: a reference to class None emits a nitpicky warning
- #7445¹⁹⁸⁴: py domain: a return annotation None in the function signature is not converted to a hyperlink when using intersphinx
- #7418¹⁹⁸⁵: std domain: duplication warning for glossary terms is case insensitive

```

¹⁹⁸⁴ https://github.com/sphinx-doc/sphinx/issues/7445

¹⁹⁸⁵ https://github.com/sphinx-doc/sphinx/issues/7418

- #7438¹⁹⁸⁶: C++, fix merging overloaded functions in parallel builds.
- #7422¹⁹⁸⁷: autodoc: fails with ValueError when using autodoc mock imports
- #7435¹⁹⁸⁸: autodoc: autodoc_typehints='description' doesn't suppress typehints in signature for classes/methods
- #7451¹⁹⁸⁹: autodoc: fails with AttributeError when an object returns non-string object as a __doc__ member
- #7423¹⁹⁹⁰: crashed when giving a non-string object to logger
- #7479¹⁹⁹¹: html theme: Do not include xmlns attribute with HTML 5 doctype
- #7426¹⁹⁹²: html theme: Escape some links in HTML templates

14.67 Release 3.0.0 (released Apr 06, 2020)

Dependencies

3.0.0b1

- LaTeX: drop dependency on **extractbb** for image inclusion in Japanese documents as .xbb files are unneeded by **dvipdfmx** since TeXLive2015 (refs: #6189¹⁹⁹³)
- babel-2.0 or above is available (Unpinned)

Incompatible changes

- Drop features and APIs deprecated in 1.8.x
- #247¹⁹⁹⁴: stub files are overwritten automatically by autosummary: autosummary_generate_overwrite to change the behavior
- #5923¹⁹⁹⁵: autodoc: the members of object class are not documented by default when :inherited-members: and :special-members: are given.
- #6830¹⁹⁹⁶: py domain: meta fields in info-field-list becomes reserved. They are not displayed on output document now
- #6417¹⁹⁹⁷: py domain: doctree of desc parameterlist has been changed. The argument names, annotations and default values are wrapped with inline node
- The structure of sphinx.events.EventManager.listeners has changed
- Due to the scoping changes for productionlist some uses of token must be modified to include the scope which was previously ignored.

```
1986 https://github.com/sphinx-doc/sphinx/issues/7438
1987 https://github.com/sphinx-doc/sphinx/issues/7422
```

¹⁹⁸⁸ https://github.com/sphinx-doc/sphinx/issues/7435

¹⁹⁸⁹ https://github.com/sphinx-doc/sphinx/issues/7451

¹⁹⁹⁰ https://github.com/sphinx-doc/sphinx/issues/7423

¹⁹⁹¹ https://github.com/sphinx-doc/sphinx/issues/7479

¹⁹⁹² https://github.com/sphinx-doc/sphinx/issues/7426

¹⁹⁹³ https://github.com/sphinx-doc/sphinx/issues/6189 1994 https://github.com/sphinx-doc/sphinx/issues/247

¹⁹⁹⁵ https://github.com/sphinx-doc/sphinx/issues/5923

¹⁹⁹⁶ https://github.com/sphinx-doc/sphinx/issues/6830

¹⁹⁹⁷ https://github.com/sphinx-doc/sphinx/issues/6417

- #6903¹⁹⁹⁸: Internal data structure of Python, reST and standard domains have changed. The node_id is added to the index of objects and modules. Now they contains a pair of docname and node_id for cross reference.
- #7276¹⁹⁹⁹: C++ domain: Non intended behavior is removed such as say_hello_links to .. cpp:function:: say_hello()
- #7210²⁰⁰⁰: js domain: Non intended behavior is removed such as parseInt_ links to .. js:function:: parseInt
- #7229²⁰⁰¹: rst domain: Non intended behavior is removed such as numref_links to .. rst:role:: numref
- #6903²⁰⁰²: py domain: Non intended behavior is removed such as say_hello_ links to .. py:function:: say_hello()
- #7246²⁰⁰³: py domain: Drop special cross reference helper for exceptions, functions and methods
- The C domain has been rewritten, with additional directives and roles. The existing ones are now more strict, resulting in new warnings.
- The attribute sphinx_cpp_tagname in the desc_signature_line node has been renamed to sphinx_line_type.
- #6462²⁰⁰⁴: double backslashes in domain directives are no longer replaced by single backslashes as default. A new configuration value *strip_signature_backslash* can be used by users to re-enable it.

3.0.0 final

• #7222²⁰⁰⁵: sphinx.util.inspect.unwrap() is renamed to unwrap_all()

Deprecated

- desc_signature['first']
- sphinx.directives.DescDirective
- sphinx.domains.std.StandardDomain.add_object()
- sphinx.domains.python.PyDecoratorMixin
- sphinx.ext.autodoc.get_documenters()
- sphinx.ext.autosummary.process_autosummary_toc()
- sphinx.parsers.Parser.app
- sphinx.testing.path.Path.text()
- sphinx.testing.path.Path.bytes()
- sphinx.util.inspect.getargspec()
- sphinx.writers.latex.LaTeXWriter.format_docclass()

²⁰⁰³ https://github.com/sphinx-doc/sphinx/issues/7246

²⁰⁰⁴ https://github.com/sphinx-doc/sphinx/issues/6462

²⁰⁰⁵ https://github.com/sphinx-doc/sphinx/issues/7222

Features added

- #247²⁰⁰⁶: autosummary: Add autosummary_generate_overwrite to overwrite old stub file
- #5923²⁰⁰⁷: autodoc: :inherited-members: option takes a name of anchestor class not to document inherited members of the class and uppers
- #6830²⁰⁰⁸: autodoc: consider a member private if docstring contains :meta private: in info-field-list
- #7165²⁰⁰⁹: autodoc: Support Annotated type (PEP-593)
- #2815²⁰¹⁰: autodoc: Support singledispatch functions and methods
- #7079²⁰¹¹: autodoc: autodoc_typehints accepts "description" configuration. It shows typehints as object description
- #7314²⁰¹²: apidoc: Propagate --maxdepth option through package documents
- #6558²⁰¹³: glossary: emit a warning for duplicated glossary entry
- #3106²⁰¹⁴: domain: Register hyperlink target for index page automatically
- #6558²⁰¹⁵: std domain: emit a warning for duplicated generic objects
- #6830²⁰¹⁶: py domain: Add new event: object-description-transform
- #6895²⁰¹⁷: py domain: Do not emit nitpicky warnings for built-in types
- py domain: Support lambda functions in function signature
- #6417²⁰¹⁸: py domain: Allow to make a style for arguments of functions and methods
- #7238²⁰¹⁹, #7239²⁰²⁰: py domain: Emit a warning on describing a python object if the entry is already added as the same name
- #7341²⁰²¹: py domain: type annotations in signature are converted to cross refs
- Support priority of event handlers. For more detail, see *Sphinx.connect()*
- #3077²⁰²²: Implement the scoping for *productionlist* as indicated in the documentation.
- #1027²⁰²³: Support backslash line continuation in *productionlist*.
- #7108²⁰²⁴: config: Allow to show an error message from conf.py via ConfigError
- #7032²⁰²⁵: html: html_scaled_image_link will be disabled for images having no-scaled-link class

```

- #7144²⁰²⁶: Add CSS class indicating its domain for each desc node
- #7211²⁰²⁷: latex: Use babel for Chinese document when using XeLaTeX
- #6672²⁰²⁸: LaTeX: Support LaTeX Theming (experimental)
- #7005²⁰²⁹: LaTeX: Add LaTeX styling macro for *kbd* role
- #7220²⁰³⁰: genindex: Show "main" index entries at first
- #7103²⁰³¹: linkcheck: writes all links to output. json
- #7025²⁰³²: html search: full text search can be disabled for individual document using :nosearch: file-wide metadata
- #7293²⁰³³; html search: Allow to override JavaScript splitter via SearchLanguage.js_splitter_code
- #7142²⁰³⁴: html theme: Add a theme option: pygments_dark_style to switch the style of code-blocks in dark mode
- The C domain has been rewritten adding for example:
 - Cross-referencing respecting the current scope.
 - Possible to document anonymous entities.
 - More specific directives and roles for each type of entity, e.g., handling scoping of enumerators.
 - New role c:expr for rendering expressions and types in text.
- Added SphinxDirective.get_source_info() and SphinxRole.get_source_info().
- #7324²⁰³⁵: sphinx-build: Emit a warning if multiple files having different file extensions for same document found

3.0.0 final

• Added ObjectDescription.transform_content().

Bugs fixed

- C++, fix cross reference lookup in certain cases involving function overloads.
- #5078²⁰³⁶: C++, fix cross reference lookup when a directive contains multiple declarations.
- C++, suppress warnings for directly dependent typenames in cross references generated automatically in signatures
- #5637²⁰³⁷: autodoc: Incorrect handling of nested class names on show-inheritance
- #7267²⁰³⁸: autodoc: error message for invalid directive options has wrong location

https://github.com/sphinx-doc/sphinx/issues/7126

sphinx.writers.latex.XELATEX_GREEK_DEFAULT_FONTPKG

Features added

- #6910²⁰⁸⁸: inheritance_diagram: Make the background of diagrams transparent
- #6446²⁰⁸⁹: duration: Add sphinx.ext.durations to inspect which documents slow down the build
- #6837²⁰⁹⁰: LaTeX: Support a nested table
- #7115²⁰⁹¹: LaTeX: Allow to override LATEXOPTS and LATEXMKOPTS via environment variable
- #6966²⁰⁹²: graphviz: Support :class: option
- #6696²⁰⁹³: html: :scale: option of image/figure directive not working for SVG images (imagesize-1.2.0 or above is required)
- #6994²⁰⁹⁴: imgconverter: Support illustrator file (.ai) to .png conversion
- autodoc: Support Positional-Only Argument separator (PEP-570 compliant)
- autodoc: Support type annotations for variables
- #2755²⁰⁹⁵: autodoc: Add new event: autodoc-before-process-signature
- #2755²⁰⁹⁶: autodoc: Support type_comment style (ex. # type: (str) -> str) annotation (python3.8+ or typed_ast²⁰⁹⁷ is required)
- #7051²⁰⁹⁸: autodoc: Support instance variables without defaults (PEP-526)
- #6418²⁰⁹⁹: autodoc: Add a new extension sphinx.ext.autodoc.typehints. It shows typehints as object description if autodoc_typehints = "description" set. This is an experimental extension and it will be integrated into autodoc core in Sphinx 3.0
- SphinxTranslator now calls visitor/departure method for super node class if visitor/departure method for original node class not found
- #6418²¹⁰⁰: Add new event: object-description-transform
- py domain: py:data and py:attribute take new options named :type: and :value: to describe its type and initial value
- #6785²¹⁰¹: py domain: :py:attr: is able to refer properties again
- #6772²¹⁰²: apidoc: Add -q option for quiet mode

²¹²⁹ https://github.com/sphinx-doc/sphinx/issues/6867

Features added

- #6707²¹³⁰: C++, support bit-fields.
- #267²¹³¹: html: Eliminate prompt characters of doctest block from copyable text
- #6548²¹³²: html: Use favicon for OpenSearch if available
- #6729²¹³³: html theme: agogo theme now supports rightsidebar option
- #6780²¹³⁴: Add PEP-561 Support
- #6762²¹³⁵: latex: Allow to load additional LaTeX packages via extrapackages key of latex_elements
- #1331²¹³⁶: Add new config variable: user_agent
- #6000²¹³⁷: LaTeX: have backslash also be an inline literal word wrap break character
- #4186²¹³⁸: LaTeX: Support upLaTeX as a new latex_engine (experimental)
- #6812²¹³⁹: Improve a warning message when extensions are not parallel safe
- #6818²¹⁴⁰: Improve Intersphinx performance for multiple remote inventories.
- #2546²¹⁴¹: apidoc: .so file support
- #6798²¹⁴²: autosummary: emit autodoc-skip-member event on generating stub file
- #6483²¹⁴³: i18n: make explicit titles in toctree translatable
- #6816²¹⁴⁴: linkcheck: Add *linkcheck_auth* option to provide authentication information when doing linkcheck builds
- #6872²¹⁴⁵: linkcheck: Handles HTTP 308 Permanent Redirect
- #6613²¹⁴⁶: html: Wrap section number in span tag
- #6781²¹⁴⁷: gettext: Add gettext_last_translator and gettext_language_team to customize headers of POT file

²¹⁴⁶ https://github.com/sphinx-doc/sphinx/issues/6613

²¹⁴⁷ https://github.com/sphinx-doc/sphinx/issues/6781

Bugs fixed

- #6668²¹⁴⁸: LaTeX: Longtable before header has incorrect distance (refs: latex3/latex2e`#173 _2149">https://github.com/sphinx-doc/sphinx/issues/173>_2149)
- #6618²¹⁵⁰: LaTeX: Avoid section names at the end of a page
- #6738²¹⁵¹: LaTeX: Do not replace unicode characters by LaTeX macros on unicode supported LaTeX engines: \P , \S , \in , ∞ , \pm , \rightarrow , \rightarrow , \rightarrow , \rightarrow , \rightarrow , on superscript and subscript digits go through "as is" (as default OpenType font supports them)
- #6704²¹⁵²: linkcheck: Be defensive and handle newly defined HTTP error code
- #6806²¹⁵³: linkcheck: Failure on parsing content
- #6655²¹⁵⁴: image URLs containing data: causes gettext builder crashed
- #6584²¹⁵⁵: i18n: Error when compiling message catalogs on Hindi
- #6718²¹⁵⁶: i18n: KevError is raised if section title and table title are same
- #6743²¹⁵⁷: i18n: rst_prolog breaks the translation
- #6708²¹⁵⁸: mathbase: Some deprecated functions have removed
- #6709²¹⁵⁹: autodoc: mock object does not work as a class decorator
- #5070²¹⁶⁰: epub: Wrong internal href fragment links
- #6712²¹⁶¹: Allow not to install sphinx.testing as runtime (mainly for ALT Linux)
- #6741²¹⁶²: html: search result was broken with empty html_file_suffix
- #6001²¹⁶³: LaTeX does not wrap long code lines at backslash character
- #6804²¹⁶⁴: LaTeX: PDF build breaks if admonition of danger type contains code-block long enough not to fit on one page
- #6809²¹⁶⁵: LaTeX: code-block in a danger type admonition can easily spill over bottom of page
- #6793²¹⁶⁶: texinfo: Code examples broken following "sidebar"
- #6813²¹⁶⁷: An orphan warning is emitted for included document on Windows. Thanks to @drillan
- #6850²¹⁶⁸: Fix smartypants module calls re.sub() with wrong options

```

2168 https://github.com/sphinx-doc/sphinx/issues/6850

- #6824²¹⁶⁹: HTML search: If a search term is partially matched in the title and fully matched in a text paragraph on the same page, the search does not include this match.
- #6848²¹⁷⁰: config.py shouldn't pop extensions from overrides
- #6867²¹⁷¹: text: extra spaces are inserted to hyphenated words on folding lines
- #6886²¹⁷²: LaTeX: xelatex converts straight double quotes into right curly ones (shows when *smartquotes* is False)
- #6890²¹⁷³: LaTeX: even with smartquotes off, PDF output transforms straight quotes and consecutive hyphens into curly quotes and dashes
- #6876²¹⁷⁴: LaTeX: multi-line display of authors on title page has ragged edges
- #6887²¹⁷⁵: Sphinx crashes with Docutils 0.16b0
- #6920²¹⁷⁶: sphinx-build: A console message is wrongly highlighted
- #6900²¹⁷⁷: sphinx-build: -D option does not considers 0 and 1 as a boolean value

14.76 Release 2.2.2 (released Dec 03, 2019)

Incompatible changes

• #6803²¹⁷⁸: For security reason of python, parallel mode is disabled on macOS and Python3.8+

- #6776²¹⁷⁹: LaTeX: 2019-10-01 LaTeX release breaks sphinxcyrillic.sty
- #6815²¹⁸⁰: i18n: French, Hindi, Chinese, Japanese and Korean translation messages has been broken
- #6803²¹⁸¹: parallel build causes AttributeError on macOS and Python3.8

14.77 Release 2.2.1 (released Oct 26, 2019)

Bugs fixed

- #6641²¹⁸²: LaTeX: Undefined control sequence \sphinxmaketitle
- #6710²¹⁸³: LaTeX not well configured for Greek language as main language
- #6759²¹⁸⁴: validation of html static paths and extra paths no longer throws an error if the paths are in different directories

14.78 Release 2.2.0 (released Aug 19, 2019)

Incompatible changes

- apidoc: template files are renamed to .rst_t
- html: Field lists will be styled by grid layout

Deprecated

- sphinx.domains.math.MathDomain.add_equation()
- sphinx.domains.math.MathDomain.get_next_equation_number()
- The info and warn arguments of sphinx.ext.autosummary.generate.generate_autosummary_docs()
- sphinx.ext.autosummary.generate._simple_info()
- sphinx.ext.autosummary.generate._simple_warn()
- sphinx.ext.todo.merge_info()
- sphinx.ext.todo.process_todo_nodes()
- sphinx.ext.todo.process_todos()
- sphinx.ext.todo.purge_todos()

Features added

- #5124²¹⁸⁵: graphviz: :graphviz_dot: option is renamed to :layout:
- #1464²¹⁸⁶: html: emit a warning if html_static_path and html_extra_path directories are inside output directory
- #6514²¹⁸⁷: html: Add a label to search input for accessability purposes
- #5602²¹⁸⁸: apidoc: Add --templatedir option

²¹⁸⁸ https://github.com/sphinx-doc/sphinx/issues/5602

- #6475²¹⁸⁹: Add override argument to app.add_autodocumenter()
- #6310²¹⁹⁰: imgmath: let imgmath_use_preview work also with the SVG format for images rendering inline math
- #6533²¹⁹¹: LaTeX: refactor visit enumerated list() to use \sphinxsetlistlabels
- #6628²¹⁹²: quickstart: Use https://docs.python.org/3/ for default setting of intersphinx_mapping
- #6419²¹⁹³: sphinx-build: give reasons why rebuilt

- py domain: duplicated warning does not point the location of source code
- #6499²¹⁹⁴: html: Sphinx never updates a copy of html_logo even if original file has changed
- #1125²¹⁹⁵: html theme: scrollbar is hard to see on classic theme and macOS
- #5502²¹⁹⁶: linkcheck: Consider HTTP 503 response as not an error
- #6439²¹⁹⁷: Make generated download links reproducible
- #6486²¹⁹⁸: UnboundLocalError is raised if broken extension installed
- #6567²¹⁹⁹: autodoc: autodoc_inherit_docstrings does not effect to __init__() and __new__()
- #6574²²⁰⁰: autodoc: autodoc_member_order does not refer order of imports when 'bysource' order
- #6574²²⁰¹: autodoc: missing type annotation for variadic and keyword parameters
- #6589²²⁰²: autodoc: Formatting issues with autodoc typehints='none'
- #6605²²⁰³: autodoc: crashed when target code contains custom method-like objects
- #6498²²⁰⁴: autosummary: crashed with wrong autosummary_generate setting
- #6507²²⁰⁵: autosummary: crashes without no autosummary generate setting
- #6511²²⁰⁶: LaTeX: autonumbered list can not be customized in LaTeX since Sphinx 1.8.0 (refs; #6533²²⁰⁷)
- #6531²²⁰⁸: Failed to load last environment object when extension added
- #736²²⁰⁹: Invalid sort in pair index

- #6527²²¹⁰: last_updated wrongly assumes timezone as UTC
- #5592²²¹¹: std domain: option directive registers an index entry for each comma separated option
- #6549²²¹²: sphinx-build: Escaped characters in error messages
- #6545²²¹³: doctest comments not getting trimmed since Sphinx 1.8.0
- #6561²²¹⁴: glossary: Wrong hyperlinks are generated for non alphanumeric terms
- #6620²²¹⁵: i18n: classifiers of definition list are not translated with Docutils 0.15
- #6474²²¹⁶: DocFieldTransformer raises AttributeError when given directive is not a subclass of ObjectDescription

14.79 Release 2.1.2 (released Jun 19, 2019)

Bugs fixed

- #6497²²¹⁷: custom lexers fails highlighting when syntax error
- #6478²²¹⁸, #6488²²¹⁹: info field lists are incorrectly recognized

14.80 Release 2.1.1 (released Jun 10, 2019)

Incompatible changes

• #6447²²²⁰: autodoc: Stop to generate document for undocumented module variables

- #6442²²²¹: LaTeX: admonitions of *note* type can get separated from immediately preceding section title by pagebreak
- #6448²²²²: autodoc: crashed when autodocumenting classes with __slots__ = None
- #6451²²²³: autodoc: generates docs for "optional import"ed modules as variables
- #6452²²²⁴: autosummary: crashed when generating document of properties
- #6455²²²⁵: napoleon: docstrings for properties are not processed

²²²⁵ https://github.com/sphinx-doc/sphinx/issues/6455

- #6436²²²⁶: napoleon: "Unknown target name" error if variable name ends with underscore
- #6440²²²⁷: apidoc: missing blank lines between modules

14.81 Release 2.1.0 (released Jun 02, 2019)

Incompatible changes

- Ignore filenames without file extension given to Builder.build_specific() API directly
- #6230²²²⁸: The anchor of term in glossary directive is changed if it is consisted by non-ASCII characters
- #4550²²²⁹: html: Centering tables by default using CSS
- #6239²²³⁰: latex: xelatex and xeCJK are used for Chinese documents by default
- Sphinx.add_lexer() now takes a Lexer class instead of instance. An instance of lexers are still supported until Sphinx 3.x.

Deprecated

- sphinx.builders.latex.LaTeXBuilder.apply_transforms()
- sphinx.builders._epub_base.EpubBuilder.esc()

- sphinx.util.i18n.find_catalog_source_files()

For more details, see deprecation APIs list.

Features added

- Add a helper class sphinx.transforms.post_transforms.SphinxPostTransform
- Add helper methods
 - PythonDomain.note_module()
 - PythonDomain.note_object()
 - SphinxDirective.set_source_info()
- #6180²²³¹: Support --keep-going with BuildDoc setup command
- math directive now supports :class: option
- todo: todo directive now supports :name: option

²²³¹ https://github.com/sphinx-doc/sphinx/issues/6180

- Enable override via environment of SPHINXOPTS and SPHINXBUILD Makefile variables (refs: #6232²²³², #6303²²³³)
- #6287²²³⁴: autodoc: Unable to document bound instance methods exported as module functions
- #6289²²³⁵: autodoc: autodoc_default_options now supports imported-members option
- #4777²²³⁶: autodoc: Support coroutine
- #744²²³⁷: autodoc: Support abstractmethod
- #6325²²³⁸: autodoc: Support attributes in __slots__. For dict-style __slots__, autodoc considers values as a docstring of the attribute
- #6361²²³⁹: autodoc: Add autodoc_typehints to suppress typehints from signature
- #1063²²⁴⁰: autodoc: automodule directive now handles undocumented module level variables
- #6212²²⁴¹ autosummary: Add autosummary_imported_members to display imported members on autosummary
- #6271²²⁴²: make clean is catastrophically broken if building into '.'
- #6363²²⁴³: Support %0% environment variable in make.bat
- #4777²²⁴⁴: py domain: Add :async: option to *py:function* directive
- py domain: Add new options to py:method directive
 - :abstractmethod:
 - :async:
 - :classmethod:
 - :property:
 - :staticmethod:
- rst domain: Add rst:directive:option directive to describe the option for directive
- #6306²²⁴⁵: html: Add a label to search form for accessability purposes
- #4390²²⁴⁶: html: Consistent and semantic CSS for signatures
- #6358²²⁴⁷: The rawsource property of production nodes now contains the full production rule
- #6373²²⁴⁸: autosectionlabel: Allow suppression of warnings
- coverage: Support a new coverage_ignore_pyobjects option

• LaTeX: Figures in admonitions produced errors (refs: #6364²²⁶⁹)

14.82 Release 2.0.1 (released Apr 08, 2019)

Bugs fixed

- LaTeX: some system labels are not translated
- RemovedInSphinx30Warning is marked as pending
- · deprecation warnings are not emitted
 - sphinx.application.CONFIG_FILENAME
 - sphinx.builders.htmlhelp
 - viewcode_import
- #6208²²⁷⁰: C++, properly parse full xrefs that happen to have a short xref as prefix
- #6220²²⁷¹, #6225²²⁷²: napoleon: AttributeError is raised for raised section having references
- #6245²²⁷³: circular import error on importing SerializingHTMLBuilder
- #6243²²⁷⁴: LaTeX: 'releasename' setting for latex_elements is ignored
- #6244²²⁷⁵: html: Search function is broken with 3rd party themes
- #6263²²⁷⁶: html: HTML5Translator crashed with invalid field node
- #6262²²⁷⁷: html theme: The style of field lists has changed in bizstyle theme

14.83 Release 2.0.0 (released Mar 29, 2019)

Dependencies

- LaTeX builder now depends on TeX Live 2015 or above.
- LaTeX builder (with 'pdflatex' latex_engine) will process Unicode Greek letters in text (not in math mark-up) via the text font and will not escape them to math mark-up. See the discussion of the 'fontenc' key of latex_elements; such (optional) support for Greek adds, for example on Ubuntu xenial, the texlive-lang-greek and (if default font set-up is not modified) cm-super(-minimal) as additional Sphinx LaTeX requirements.
- LaTeX builder with <code>latex_engine</code> set to <code>'xelatex'</code> or to <code>'lualatex'</code> requires (by default) the <code>FreeFont</code> fonts, which in Ubuntu xenial are provided by package <code>fonts-freefont-otf</code>, and e.g. in Fedora 29 via package <code>texlive-gnu-freefont</code>.

- Some packages are separated to sub packages:
 - sphinxcontrib.applehelp
 - sphinxcontrib.devhelp
 - sphinxcontrib.htmlhelp
 - sphinxcontrib.jsmath
 - sphinxcontrib.serializinghtml
 - sphinxcontrib.qthelp

Incompatible changes

- Drop python 2.7 and 3.4 support
- Drop Docutils 0.11 support
- Drop features and APIs deprecated in 1.7.x
- The default setting for master_doc is changed to 'index' which has been longly used as default of sphinx-quickstart.
- LaTeX: Move message resources to sphinxmessage.sty
- LaTeX: Stop using \captions<lang> macro for some labels
- LaTeX: for 'xelatex' and 'lualatex', use the FreeFont OpenType fonts as default choice (refs: #5645²²⁷⁸)
- LaTeX: 'xelatex' and 'lualatex' now use \small in code-blocks (due to FreeMono character width) like 'pdflatex' already did (due to Courier character width). You may need to adjust this via latex_elements 'fvset' key, in case of usage of some other OpenType fonts (refs: #5768²²⁷⁹)
- LaTeX: Greek letters in text are not escaped to math mode mark-up, and they will use the text font not the math font. The LGR font encoding must be added to the 'fontenc' key of <code>latex_elements</code> for this to work (only if it is needed by the document, of course).
- LaTeX: setting the language to 'en' triggered Sonny option of fncychap, now it is Bjarne to match case of no language specified. (refs: #5772²²⁸⁰)
- #5770²²⁸¹: doctest: Follow *highlight_language* on highlighting doctest block. As a result, they are highlighted as python3 by default.
- The order of argument for HTMLTranslator, HTML5Translator and ManualPageTranslator are changed
- LaTeX: hard-coded redefinitions of \l@section and \l@subsection formerly done during loading of 'manual' docclass get executed later, at time of \sphinxtableofcontents. This means that custom user definitions from LaTeX preamble now get overwritten. Use \sphinxtableofcontentshook to insert custom user definitions. See *Macros*.
- quickstart: Simplify generated conf.py

²²⁷⁸ https://github.com/sphinx-doc/sphinx/issues/5645

²²⁷⁹ https://github.com/sphinx-doc/sphinx/issues/5768

²²⁸⁰ https://github.com/sphinx-doc/sphinx/issues/5772

²²⁸¹ https://github.com/sphinx-doc/sphinx/issues/5770

- #4148²²⁸²: quickstart: some questions are removed. They are still able to specify via command line options
- websupport: unbundled from Sphinx core. Please use sphinxcontrib-websupport
- C++, the visibility of base classes is now always rendered as present in the input. That is, private is now shown, where it was ellided before.
- LaTeX: graphics inclusion of oversized images rescales to not exceed the text width and height, even if width and/or height option were used. (refs: #5956²²⁸³)
- epub: epub_title defaults to the *project* option
- #4550²²⁸⁴: All tables and figures without align option are displayed to center
- #4587²²⁸⁵: html: Output HTML5 by default

2.0.0b2

• texinfo: image files are copied into name-figure directory

Deprecated

- Support for evaluating Python 2 syntax is deprecated. This includes configuration files which should be converted to Python 3.
- The arguments of EpubBuilder.build_mimetype(), EpubBuilder.build_container(), EpubBuilder.build_content(), EpubBuilder.build_toc() and EpubBuilder.build_epub()
- The arguments of Epub3Builder.build_navigation_doc()
- The config variables
 - html_experimental_html5_writer
- The encoding argument of autodoc.Documenter.get_doc(), autodoc.DocstringSignatureMixin.get_doc(), autodoc.DocstringSignatureMixin._find_signature(), and autodoc.ClassDocumenter.get_doc() are deprecated.
- The importer argument of sphinx.ext.autodoc.importer._MockModule
- The nodetype argument of sphinx.search.WordCollector. is_meta_keywords()
- The suffix argument of env.doc2path() is deprecated.
- The string style base argument of env.doc2path() is deprecated.
- The fallback to allow omitting the filename argument from an overridden IndexBuilder.feed() method is deprecated.
- sphinx.addnodes.abbreviation
- sphinx.application.Sphinx._setting_up_extension
- sphinx.builders.epub3.Epub3Builder.validate_config_value()
- sphinx.builders.html.SingleFileHTMLBuilder
- sphinx.builders.htmlhelp.HTMLHelpBuilder.open_file()
- sphinx.cmd.quickstart.term_decode()

 - translatablestrings

For more details, see deprecation APIs list.

Features added

- #1618²²⁸⁶: The search results preview of generated HTML documentation is reader-friendlier: instead of showing the snippets as raw reStructuredText markup, Sphinx now renders the corresponding HTML. This means the Sphinx extension Sphinx: pretty search results²²⁸⁷ is no longer necessary. Note that changes to the search function of your custom or 3rd-party HTML template might overwrite this improvement.
- #4182²²⁸⁸: autodoc: Support suppress_warnings
- #5533²²⁸⁹: autodoc: autodoc_default_options supports member-order
- #5394²²⁹⁰: autodoc: Display readable names in type annotations for mocked objects
- #5459²²⁹¹: autodoc: autodoc_default_options accepts True as a value
- #1148²²⁹²: autodoc: Add autodecorator directive for decorators
- #5635²²⁹³: autosummary: Add autosummary_mock_imports to mock external libraries on importing targets
- #4018²²⁹⁴: htmlhelp: Add htmlhelp_file_suffix and htmlhelp_link_suffix

 $^{^{2286}\} https://github.com/sphinx-doc/sphinx/issues/1618$

https://github.com/sphinx-doc/sphinx/issues/5635

²²⁹⁴ https://github.com/sphinx-doc/sphinx/issues/4018

- #5559²²⁹⁵: text: Support complex tables (colspan and rowspan)
- LaTeX: support rendering (not in math, yet) of Greek and Cyrillic Unicode letters in non-Cyrillic document even with 'pdflatex' as latex_engine (refs: #5645²²⁹⁶)
- #5660²²⁹⁷: The versionadded, versionchanged and deprecated directives are now generated with their own specific CSS classes (added, changed and deprecated, respectively) in addition to the generic versionmodified class.
- #5841²²⁹⁸: apidoc: Add –extensions option to sphinx-apidoc
- #4981²²⁹⁹: C++, added an alias directive for inserting lists of declarations, that references existing declarations (e.g., for making a synopsis).
- C++: add cpp:struct to complement cpp:class.
- #1341²³⁰⁰ the HTML search considers words that contain a search term of length three or longer a match.
- #4611²³⁰¹: epub: Show warning for duplicated ToC entries
- #1851²³⁰²: Allow to omit an argument for code-block directive. If omitted, it follows highlight or highlight_language
- #4587²³⁰³: html: Add html4 writer to use old HTML4 writer
- #6016²³⁰⁴: HTML search: A placeholder for the search summary prevents search result links from changing their position when the search terminates. This makes navigating search results easier.
- #5196²³⁰⁵: linkcheck also checks remote images exist
- #5924²³⁰⁶: githubpages: create CNAME file for custom domains when html_baseurl set
- #4261²³⁰⁷: autosectionlabel: restrict the labeled sections by new config value; autosectionlabel_maxdepth

Bugs fixed

- #1682²³⁰⁸: LaTeX: writer should not translate Greek unicode, but use textgreek package
- #5247²³⁰⁹: LaTeX: PDF does not build with default font config for Russian language and 'xelatex' or 'lualatex' as latex_engine (refs: #5251²³¹⁰)
- #5248²³¹¹: LaTeX: Greek letters in section titles disappear from PDF bookmarks

- #6068²³⁴⁰: doctest: skipif option may remove the code block from documentation
- #6136²³⁴¹: :name: option for math directive causes a crash
- #6139²³⁴²: intersphinx: ValueError on failure reporting
- #6135²³⁴³: changes: Fix UnboundLocalError when any module found
- #3859²³⁴⁴: manpage: code-block captions are not displayed correctly

14.86 Release 1.8.4 (released Feb 03, 2019)

- #3707²³⁴⁵: latex: no bold checkmark (\checkmark) available.
- #5605²³⁴⁶: with the documentation language set to Chinese, English words could not be searched.
- #5889²³⁴⁷: LaTeX: user numfig_format is stripped of spaces and may cause build failure
- C++, fix hyperlinks for declarations involving east cv-qualifiers.
- #5755²³⁴⁸: C++, fix duplicate declaration error on function templates with constraints in the return type.
- C++, parse unary right fold expressions and binary fold expressions.
- pycode could not handle egg files on windows
- #5928²³⁴⁹: KeyError: 'DOCUTILSCONFIG' when running build
- #5936²³⁵⁰: LaTeX: PDF build broken by inclusion of image taller than page height in an admonition
- #5231²³⁵¹: "make html" does not read and build "po" files in "locale" dir
- #5954²³⁵²: :scale: image option may break PDF build if image in an admonition
- #5966²³⁵³: mathjax has not been loaded on incremental build
- #5960²³⁵⁴: LaTeX: modified PDF layout since September 2018 TeXLive update of parskip.sty
- #5948²³⁵⁵: LaTeX: duplicated labels are generated for sections
- #5958²³⁵⁶: versionadded directive causes crash with Python 3.5.0
- #5995²³⁵⁷: autodoc: autodoc mock imports conflict with metaclass on Python 3.7

• #5871²³⁵⁸: texinfo: a section title . is not allowed

14.87 Release 1.8.3 (released Dec 26, 2018)

Features added

• LaTeX: it is possible to insert custom material to appear on back of title page, see discussion of 'maketitle' key of latex_elements ('manual' docclass only)

- #5725²³⁵⁹: mathjax: Use CDN URL for "latest" version by default
- #5460²³⁶⁰: html search does not work with some 3rd party themes
- #5520²³⁶¹: LaTeX, caption package incompatibility since Sphinx 1.6
- #5614²³⁶²: autodoc: incremental build is broken when builtin modules are imported
- #5627²³⁶³: qthelp: index.html missing in QtHelp
- #5659²³⁶⁴: linkcheck: crashes for a hyperlink containing multibyte character
- #5754²³⁶⁵: DOC: Fix some mistakes in *LaTeX customization*
- #5810²³⁶⁶; LaTeX: sphinxVerbatim requires explicit "hllines" set-up since 1.6.6 (refs; #1238²³⁶⁷)
- #5636²³⁶⁸: C++, fix parsing of floating point literals.
- #5496²³⁶⁹ (again): C++, fix assertion in partial builds with duplicates.
- #5724²³⁷⁰: quickstart: sphinx-quickstart fails when \$LC ALL is empty
- #1956²³⁷¹: Default conf.py is not PEP8-compliant
- #5849²³⁷²: LaTeX: document class \maketitle is overwritten with no possibility to use original meaning in place of Sphinx custom one
- #5834²³⁷³: apidoc: wrong help for --tocfile
- #5800²³⁷⁴: todo: crashed if todo is defined in TextElement
- #5846²³⁷⁵: htmlhelp: convert hex escaping to decimal escaping in .hhc/.hhk files

• htmlhelp: broken .hhk file generated when title contains a double quote

14.88 Release 1.8.2 (released Nov 11, 2018)

Incompatible changes

• #5497²³⁷⁶: Do not include MathJax.js and jsmath.js unless it is really needed

Features added

• #5471²³⁷⁷: Show appropriate deprecation warnings

- #5490²³⁷⁸: latex: enumerated list causes a crash with recommonmark
- #5492²³⁷⁹: sphinx-build fails to build docs w/ Python < 3.5.2
- #3704²³⁸⁰: latex: wrong \label positioning for figures with a legend
- #5496²³⁸¹: C++, fix assertion when a symbol is declared more than twice.
- #5493²³⁸²: gettext: crashed with broken template
- #5495²³⁸³: csv-table directive with file option in included file is broken (refs: #4821²³⁸⁴)
- #5498²³⁸⁵: autodoc: unable to find type hints for a functools.partial
- #5480²³⁸⁶: autodoc: unable to find type hints for unresolvable Forward references
- #5419²³⁸⁷: incompatible math_block node has been generated
- #5548²³⁸⁸: Fix ensuredir() in case of pre-existing file
- #5549²³⁸⁹: graphviz Correctly deal with non-existing static dir
- #3002²³⁹⁰: i18n: multiple footnote references referring same footnote cause duplicated node ids
- #5563²³⁹¹: latex: footnote_references generated by extension causes a LaTeX builder crash
- #5561²³⁹²: make all-pdf fails with old xindy version

- #5557²³⁹³: quickstart: –no-batchfile isn't honored
- #3080²³⁹⁴: texinfo: multiline rubrics are broken
- #3080²³⁹⁵: texinfo: multiline citations are broken

14.89 Release 1.8.1 (released Sep 22, 2018)

Incompatible changes

• LaTeX \pagestyle commands have been moved to the LaTeX template. No changes in PDF, except possibly if \sphinxtableofcontents, which contained them, had been customized in conf.py. (refs: #5455²³⁹⁶)

- #5418²³⁹⁷: Incorrect default path for sphinx-build -d/doctrees files
- #5421²³⁹⁸: autodoc emits deprecation warning for autodoc_default_flags
- #5422²³⁹⁹: lambda object causes PicklingError on storing environment
- #5417²⁴⁰⁰: Sphinx fails to build with syntax error in Python 2.7.5
- #4911²⁴⁰¹: add latexpdf to make.bat for non make-mode
- #5436²⁴⁰²: Autodoc does not work with enum subclasses with properties/methods
- #5437²⁴⁰³: autodoc: crashed on modules importing eggs
- #5433²⁴⁰⁴: latex: ImportError: cannot import name 'DEFAULT SETTINGS'
- #5431²⁴⁰⁵: autodoc: autofunction emits a warning for callable objects
- #5457²⁴⁰⁶: Fix TypeError in error message when override is prohibited
- #5453²⁴⁰⁷: PDF builds of 'howto' documents have no page numbers
- #5463²⁴⁰⁸: mathbase: math_role and MathDirective was disappeared in 1.8.0
- #5454²⁴⁰⁹: latex: Index has disappeared from PDF for Japanese documents
- #5432²⁴¹⁰: py domain: :type: field can't process :term: references

• #5426²⁴¹¹: py domain: TypeError has been raised for class attribute

14.90 Release 1.8.0 (released Sep 13, 2018)

Dependencies

1.8.0b1

- LaTeX: latex_use_xindy, if True (default for xelatex/lualatex), instructs make latexpdf to use **xindy** for general index. Make sure your LaTeX distribution includes it. (refs: #5134²⁴¹²)
- LaTeX: latexmk is required for make latexpdf on Windows

Incompatible changes

1.8.0b2

- #5282²⁴¹³: html theme: refer pygments_style settings of HTML themes preferentially
- The URL of download files are changed
- #5127²⁴¹⁴: quickstart: Makefile and make.bat are not overwritten if exists

1.8.0b1

- #5156²⁴¹⁵: the *sphinx.ext.graphviz* extension runs dot in the directory of the document being built instead of in the root directory of the documentation.
- #4460²⁴¹⁶: extensions which stores any data to environment should return the version of its env data structure as metadata. In detail, please see *Extension metadata*.
- · Sphinx expects source parser modules to have supported file formats as Parser. supported attribute
- The default value of *epub_author* and *epub_publisher* are changed from 'unknown' to the value of *author*. This is same as a conf.py file sphinx-build generates.
- The gettext_compact attribute is removed from document.settings object. Please use config. gettext_compact instead.
- The processing order on reading phase is changed. smart_quotes, sphinx domains, *doctree-read* event and versioning doctrees are invoked earlier than so far. For more details, please read a description of *Sphinx*. add_transform()
- #4827²⁴¹⁷: All substitution_definition nodes are removed from doctree on reading phase
- docutils.conf in \$HOME or /etc directories are ignored. Only docutils.conf from confdir is obeyed.
- #789²⁴¹⁸: :samp: role supports to escape curly braces with backslash
- #4811²⁴¹⁹: The files under html_static_path are excluded from source files.
- latex: Use \sphinxcite for citation references instead \hyperref

²⁴¹¹ https://github.com/sphinx-doc/sphinx/issues/5426

²⁴¹² https://github.com/sphinx-doc/sphinx/issues/5134

²⁴¹³ https://github.com/sphinx-doc/sphinx/issues/5282

²⁴¹⁴ https://github.com/sphinx-doc/sphinx/issues/5127

²⁴¹⁵ https://github.com/sphinx-doc/sphinx/issues/5156

²⁴¹⁶ https://github.com/sphinx-doc/sphinx/issues/4460

https://github.com/sphinx-doc/sphinx/issues/4827

²⁴¹⁸ https://github.com/sphinx-doc/sphinx/issues/789

²⁴¹⁹ https://github.com/sphinx-doc/sphinx/issues/4811

- The config value viewcode_import is renamed to viewcode_follow_imported_members (refs: #4035²⁴²⁰)
- #1857²⁴²¹: latex: latex_show_pagerefs does not add pagerefs for citations
- #4648²⁴²²: latex: Now "rubric" elements are rendered as unnumbered section title
- #4983²⁴²³: html: The anchor for productionlist tokens has been changed
- Modifying a template variable script_files in templates is allowed now. Please use app.add_js_file() instead.
- #5072²⁴²⁴: Save environment object also with only new documents
- #5035²⁴²⁵: gthelp builder allows dashes in gthelp_namespace
- LaTeX: with lualatex or xelatex use by default **xindy** as UTF-8 able replacement of **makeindex** (refs: #5134²⁴²⁶). After upgrading Sphinx, please clean latex build repertory of existing project before new build.
- #5163²⁴²⁷: html: hlist items are now aligned to top
- highlightlang directive is processed on resolving phase
- #4000²⁴²⁸: LaTeX: template changed. Following elements moved to it:
 - \begin{document}
 - shorthandoff variable
 - maketitle variable
 - tableofcontents variable

Deprecated

1.8.0b2

- sphinx.io.SphinxI18nReader.set_lineno_for_reporter() is deprecated
- sphinx.io.SphinxI18nReader.line is deprecated
- sphinx.util.i18n.find_catalog_source_file() has changed; the gettext_compact argument has been
- #5403²⁴²⁹: sphinx.util.images.guess_mimetype() has changed; the *content* argument has been deprecated

1.8.0b1

- source_parsers is deprecated
- autodoc_default_flags is deprecated
- quickstart: --epub option becomes default, so it is deprecated
- Drop function based directive support. For now, Sphinx only supports class based directives (see *Directive*)

- env.versionchanges is deprecated
- env.dump() is deprecated
- env.dumps() is deprecated
- env.topickle() is deprecated
- env.note_versionchange() is deprecated
- sphinx.writers.latex.Table.caption_footnotetexts is deprecated
- sphinx.writers.latex.Table.header_footnotetexts is deprecated
- sphinx.writers.latex.LaTeXTranslator.footnotestack is deprecated
- sphinx.writers.latex.LaTeXTranslator.in_container_literal_block is deprecated
- sphinx.writers.latex.LaTeXTranslator.next_section_ids is deprecated

²⁴³⁰ https://github.com/sphinx-doc/sphinx/issues/2157

- sphinx.writers.latex.LaTeXTranslator.next_hyperlink_ids is deprecated
- sphinx.writers.latex.LaTeXTranslator.restrict_footnote() is deprecated
- $\bullet \ \ sphinx.writers.latex.LaTeXTranslator.unrestrict_footnote() \ is \ deprecated$
- sphinx.writers.latex.LaTeXTranslator.push_hyperlink_ids() is deprecated
- sphinx.writers.latex.LaTeXTranslator.pop_hyperlink_ids() is deprecated
- sphinx.writers.latex.LaTeXTranslator.check_latex_elements() is deprecated
- sphinx.writers.latex.LaTeXTranslator.bibitems is deprecated
- sphinx.writers.latex.LaTeXTranslator.hlsettingstack is deprecated
- sphinx.writers.latex.ExtBabel.get_shorthandoff() is deprecated
- sphinx.writers.html.HTMLTranslator.highlightlang is deprecated
- sphinx.writers.html.HTMLTranslator.highlightlang_base is deprecated
- sphinx.writers.html.HTMLTranslator.highlightlangopts is deprecated
- sphinx.writers.html.HTMLTranslator.highlightlinenothreshold is deprecated
- sphinx.writers.html5.HTMLTranslator.highlightlang is deprecated
- sphinx.writers.html5.HTMLTranslator.highlightlang_base is deprecated
- sphinx.writers.html5.HTMLTranslator.highlightlangopts is deprecated
- sphinx.writers.html5.HTMLTranslator.highlightlinenothreshold is deprecated
- sphinx.ext.mathbase extension is deprecated
- sphinx.ext.mathbase.math node is deprecated
- sphinx.ext.mathbase.displaymath node is deprecated
- sphinx.ext.mathbase.eqref node is deprecated
- sphinx.ext.mathbase.is_in_section_title() is deprecated
- sphinx.ext.mathbase.MathDomain is deprecated
- sphinx.ext.mathbase.MathDirective is deprecated
- sphinx.ext.mathbase.math_role is deprecated
- sphinx.ext.mathbase.setup_math() is deprecated
- $\hbox{\color{red} \bullet sphinx.directives.other.} Version Changes \ is \ deprecated$
- sphinx.highlighting.PygmentsBridge.unhighlight() is deprecated
- sphinx.ext.mathbase.get_node_equation_number() is deprecated
- sphinx.ext.mathbase.wrap_displaymath() is deprecated
- The trim_doctest_flags argument of sphinx.highlighting.PygmentsBridge is deprecated

For more details, see deprecation APIs list.

Features added

1.8.0b2

- #5388²⁴³¹: Ensure frozen object descriptions are reproducible
- #5362²⁴³²: apidoc: Add --tocfile option to change the filename of ToC

1.8.0b1

- Add config-inited event
- Add sphinx.config. Any to represent the config value accepts any type of value
- source_suffix allows a mapping fileext to file types
- Add author as a configuration value
- #2852²⁴³³: imgconverter: Support to convert GIF to PNG
- sphinx-build command supports i18n console output
- Add app.add_message_catalog() and sphinx.locale.get_translations() to support translation for 3rd party extensions
- helper function warning() for HTML themes is added
- Add Domain.enumerable_nodes to manage own enumerable nodes for domains (experimental)
- Add a new keyword argument override to Application APIs
- LaTeX: new key 'fvset' for latex_elements. For XeLaTeX/LuaLaTeX its default sets fanvyvrb to use normal, not small, fontsize in code-blocks (refs: #4793²⁴³⁴)
- Add html_css_files and epub_css_files for adding CSS files from configuration
- Add https://html.js_files for adding JS files from configuration
- #4834²⁴³⁵: Ensure set object descriptions are reproducible.
- #4828²⁴³⁶: Allow to override *numfig_format* partially. Full definition is not needed.
- Improve warning messages during including (refs: #4818²⁴³⁷)
- LaTeX: separate customizability of guilabel and menuselection (refs: #4830²⁴³⁸)
- Add Config.read() classmethod to create a new config object from configuration file
- #4866²⁴³⁹: Wrap graphviz diagrams in <div> tag
- viewcode: Add viewcode-find-source and viewcode-follow-imported to load source code without loading
- #4785²⁴⁴⁰: napoleon: Add strings to translation file for localisation
- #4927²⁴⁴¹: Display a warning when invalid values are passed to linenothreshold option of highlight directive

²⁴⁴⁰ https://github.com/sphinx-doc/sphinx/issues/4785

²⁴⁴¹ https://github.com/sphinx-doc/sphinx/issues/4927

- C++:
 - Add a cpp:texpr role as a sibling to cpp:expr.
 - Add support for unions.
 - #3593²⁴⁴², #2683²⁴⁴³: add support for anonymous entities using names staring with @.
 - #5147²⁴⁴⁴: add support for (most) character literals.
 - Cross-referencing entities inside primary templates is supported, and now properly documented.
 - #1552²⁴⁴⁵: add new cross-referencing format for cpp:any and cpp:func roles, for referencing specific function overloads.
- #3606²⁴⁴⁶: MathJax should be loaded with async attribute
- html: Output canonical_url metadata if html_baseurl set (refs: #4193²⁴⁴⁷)
- #5029²⁴⁴⁸: autosummary: expose inherited_members to template
- #3784²⁴⁴⁹: mathjax: Add mathjax_options to give options to script tag for mathjax
- #726²⁴⁵⁰, #969²⁴⁵¹: mathjax: Add mathjax_config to give in-line configurations for mathjax
- #4362²⁴⁵²: latex: Don't overwrite .tex file if document not changed
- #1431²⁴⁵³: latex: Add alphanumeric enumerated list support
- Add latex_use_xindy for UTF-8 savvy indexing, defaults to True if latex_engine is 'xelatex' or 'lualatex'. (refs: #5134²⁴⁵⁴, #5192²⁴⁵⁵, #5212²⁴⁵⁶)
- #4976²⁴⁵⁷: SphinxLoggerAdapter.info() now supports location parameter
- #5122²⁴⁵⁸: setuptools: support nitpicky option
- #2820²⁴⁵⁹: autoclass directive supports nested class
- Add app.add_html_math_renderer() to register a math renderer for HTML
- Apply trim_doctest_flags to all builders (cf. text, manpages)
- #5140²⁴⁶⁰: linkcheck: Add better Accept header to HTTP client
- #4614²⁴⁶¹: sphinx-build: Add --keep-going option to show all warnings
- Add math:numref role to refer equations (Same as eq)

²⁴⁶¹ https://github.com/sphinx-doc/sphinx/issues/4614

- quickstart: epub builder is enabled by default
- #5246²⁴⁶²: Add singlehtml_sidebars to configure sidebars for singlehtml builder
- #5273²⁴⁶³: doctest: Skip doctest conditionally
- #5306²⁴⁶⁴: autodoc: emit a warning for invalid typehints
- #4075²⁴⁶⁵, #5215²⁴⁶⁶; autodoc; Add autodoc default options which accepts option values as dict

Bugs fixed

1.8.0b2

- html: search box overrides to other elements if scrolled
- i18n: warnings for translation catalogs have wrong line numbers (refs: #5321²⁴⁶⁷)
- #5325²⁴⁶⁸: latex: cross references has been broken by multiply labeled objects
- C++, fixes for symbol addition and lookup. Lookup should no longer break in partial builds. See also #5337²⁴⁶⁹.
- #5348²⁴⁷⁰: download reference to remote file is not displayed
- #5282²⁴⁷¹: html theme: pygments_style of theme was overridden by conf.py by default
- #4379²⁴⁷²: toctree shows confusing warning when document is excluded
- #2401²⁴⁷³: autodoc: :members: causes :special-members: not to be shown
- autodoc: ImportError is replaced by AttributeError for deeper module
- #2720²⁴⁷⁴, #4034²⁴⁷⁵: Incorrect links with :download:, duplicate names, and parallel builds
- #5290²⁴⁷⁶: autodoc: failed to analyze source code in egg package
- #5399²⁴⁷⁷: Sphinx crashes if unknown po file exists

1.8.0b1

- i18n: message catalogs were reset on each initialization
- #4850²⁴⁷⁸: latex: footnote inside footnote was not rendered
- #4945²⁴⁷⁹: i18n: fix lang COUNTRY not fallback correctly for IndexBuilder. Thanks to Shengjing Zhu.
- #4983²⁴⁸⁰: productionlist directive generates invalid IDs for the tokens

- #4272²⁵²⁵: PDF builds of French projects have issues with XeTeX
- #5076²⁵²⁶: napoleon raises RuntimeError with python 3.7
- #5125²⁵²⁷: sphinx-build: Interface of sphinx:main() has changed
- sphinx-build: sphinx.cmd.build.main() refers sys.argv instead of given argument
- #5146²⁵²⁸; autosummary; warning is emitted when the first line of docstring ends with literal notation
- autosummary: warnings of autosummary indicates wrong location (refs: #5146²⁵²⁹)
- #5143²⁵³⁰: autodoc: crashed on inspecting dict like object which does not support sorting
- #5139²⁵³¹: autodoc: Enum argument missing if it shares value with another
- #4946²⁵³²: py domain: rtype field could not handle "None" as a type
- #5176²⁵³³: LaTeX: indexing of terms containing @, !, or " fails
- #5161²⁵³⁴: html: crashes if copying static files are failed
- #5167²⁵³⁵: autodoc: Fix formatting type annotations for tuples with more than two arguments
- #3329²⁵³⁶: i18n: crashed by auto-symbol footnote references
- #5158²⁵³⁷: autosummary: module summary has been broken when it starts with heading

14.95 Release 1.7.5 (released May 29, 2018)

- #4924²⁵³⁸: html search: Upper characters problem in any other languages
- #4932²⁵³⁹: apidoc: some subpackage is ignored if sibling subpackage contains a module starting with underscore
- #4863²⁵⁴⁰, #4938²⁵⁴¹, #4939²⁵⁴²: i18n doesn't handle correctly node title as used for contents, topic, admonition, table and section.
- #4913²⁵⁴³: i18n: literal blocks in bullet list are not translated
- #4962²⁵⁴⁴: C++, raised TypeError on duplicate declaration.

- #4825²⁵⁴⁵: C++, properly parse expr roles and give better error messages when (escaped) line breaks are present.
- C++, properly use desc_addname nodes for prefixes of names.
- C++, parse pack expansions in function calls.
- #4915²⁵⁴⁶, #4916²⁵⁴⁷: links on search page are broken when using dirhtml builder
- #4969²⁵⁴⁸: autodoc: constructor method should not have return annotation
- latex: deeply nested enumerated list which is beginning with non-1 causes LaTeX engine crashed
- #4978²⁵⁴⁹: latex: shorthandoff is not set up for Brazil locale
- #4928²⁵⁵⁰: i18n: Ignore dot-directories like .git/ in LC MESSAGES/
- #4946²⁵⁵¹: py domain: type field could not handle "None" as a type
- #4979²⁵⁵²: latex: Incorrect escaping of curly braces in index entries
- #4956²⁵⁵³: autodoc: Failed to extract document from a subclass of the class on mocked module
- #4973²⁵⁵⁴: latex: glossary directive adds whitespace to each item
- #4980²⁵⁵⁵: latex: Explicit labels on code blocks are duplicated
- #4919²⁵⁵⁶: node.asdom() crashes if toctree has :numbered: option
- #4914²⁵⁵⁷: autodoc: Parsing error when using dataclasses without default values
- #4931²⁵⁵⁸: autodoc: crashed when handler for autodoc-skip-member raises an error
- #4931²⁵⁵⁹: autodoc: crashed when subclass of mocked class are processed by napoleon module
- #5007²⁵⁶⁰: sphinx-build crashes when error log contains a "%" character

14.96 Release 1.7.4 (released Apr 25, 2018)

- #4885²⁵⁶¹, #4887²⁵⁶²; domains: Crashed with duplicated objects
- #4889²⁵⁶³: latex: sphinx.writers.latex causes recursive import

14.97 Release 1.7.3 (released Apr 23, 2018)

Bugs fixed

- #4769²⁵⁶⁴: autodoc loses the first staticmethod parameter
- #4790²⁵⁶⁵: autosummary: too wide two column tables in PDF builds
- #4795²⁵⁶⁶: Latex customization via _templates/longtable.tex_t is broken
- #4789²⁵⁶⁷: imgconverter: confused by convert.exe of Windows
- #4783²⁵⁶⁸: On windows, Sphinx crashed when drives of srcdir and outdir are different
- #4812²⁵⁶⁹: autodoc ignores type annotated variables
- #4817²⁵⁷⁰: wrong URLs on warning messages
- #4784²⁵⁷¹: latex: *latex_show_urls* assigns incorrect footnote numbers if hyperlinks exists inside substitutions
- #4837²⁵⁷²: latex with class memoir Error: Font command \sf is not supported
- #4803²⁵⁷³: latex: too slow in proportion to number of auto numbered footnotes
- #4838²⁵⁷⁴: htmlhelp: The entries in .hhp file is not ordered
- toctree directive tries to glob for URL having query_string
- #4871²⁵⁷⁵: html search: Upper characters problem in German
- #4717²⁵⁷⁶: latex: Compilation for German docs failed with LuaLaTeX and XeLaTeX
- #4459²⁵⁷⁷: duplicated labels detector does not work well in parallel build
- #4878²⁵⁷⁸: Crashed with extension which returns invalid metadata

14.98 Release 1.7.2 (released Mar 21, 2018)

Incompatible changes

• #4520²⁵⁷⁹: apidoc: folders with an empty __init__.py are no longer excluded from TOC

14.99 Release 1.7.1 (released Feb 23, 2018)

Deprecated

- #4623²⁵⁹⁹: sphinx.build_main() is deprecated.
- autosummary: The interface of sphinx.ext.autosummary.get_documenter() has been changed (Since 1.7.0)
- #4664²⁶⁰⁰: sphinx.ext.intersphinx.debug() is deprecated.

For more details, see deprecation APIs list.

Bugs fixed

- #4608²⁶⁰¹: epub: Invalid meta tag is generated
- #4260²⁶⁰²: autodoc: keyword only argument separator is not disappeared if it is appeared at top of the argument list
- #4622²⁶⁰³: epub: *epub_scheme* does not effect to content.opf
- #4627²⁶⁰⁴: graphviz: Fit graphviz images to page
- #4617²⁶⁰⁵: quickstart: PROJECT_DIR argument is required
- #4623²⁶⁰⁶: sphinx.build_main no longer exists in 1.7.0
- #4615²⁶⁰⁷: The argument of sphinx.build has been changed in 1.7.0
- autosummary: The interface of sphinx.ext.autosummary.get_documenter() has been changed
- #4630²⁶⁰⁸: Have order on msgids in sphinx.pot deterministic
- #4563²⁶⁰⁹: autosummary: Incorrect end of line punctuation detection
- #4577²⁶¹⁰: Enumerated sublists with explicit start with wrong number
- #4641²⁶¹¹: A external link in TOC cannot contain "?" with :glob: option
- C++, add missing parsing of explicit casts and typeid in expression parsing.
- C++, add missing parsing of this in expression parsing.
- #4655²⁶¹²: Fix incomplete localization strings in Polish
- #4653²⁶¹³: Fix error reporting for parameterless ImportErrors

- #4664²⁶¹⁴: Reading objects.inv fails again
- #4662²⁶¹⁵: any refs with term targets crash when an ambiguity is encountered

14.100 Release 1.7.0 (released Feb 12, 2018)

Dependencies

1.7.0b1

• Add packaging package

Incompatible changes

- #3668²⁶¹⁶: The arguments has changed of main functions for each command
- #3893²⁶¹⁷: Unknown html theme options throw warnings instead of errors
- #3927²⁶¹⁸: Python parameter/variable types should match classes, not all objects
- #3962²⁶¹⁹: sphinx-apidoc now recognizes given directory as an implicit namespace package when --implicit-namespaces option given, not subdirectories of given directory.
- #3929²⁶²⁰: apidoc: Move sphinx.apidoc to sphinx.ext.apidoc
- #4226²⁶²¹: apidoc: Generate new style makefile (make-mode)
- #4274²⁶²²: sphinx-build returns 2 as an exit code on argument error
- #4389²⁶²³: output directory will be created after loading extensions
- autodoc does not generate warnings messages to the generated document even if *keep_warnings* is True. They are only emitted to stderr.
- shebang line is removed from generated conf.py
- #2557²⁶²⁴: autodoc: autodoc_mock_imports only mocks specified modules with their descendants. It does not mock their ancestors. If you want to mock them, please specify the name of ancestors explicitly.
- #3620²⁶²⁵: html theme: move DOCUMENTATION OPTIONS to independent JavaScript file (refs: #4295²⁶²⁶)
- #4246²⁶²⁷: Limit width of text body for all themes. Configurable via theme options body_min_width and body_max_width.

• #4771²⁶²⁸: apidoc: The exclude_patterns arguments are ignored if they are placed just after command line options

1.7.0b2

• #4467²⁶²⁹: html theme: Rename csss block to css

Deprecated

1.7.0b1

- using a string value for html_sidebars is deprecated and only list values will be accepted at 2.0.
- format_annotation() and formatargspec() is deprecated. Please use sphinx.util.inspect. Signature instead.
- sphinx.ext.autodoc.AutodocReporter is replaced by sphinx.util.docutils. switch_source_input() and now deprecated. It will be removed in Sphinx 2.0.
- sphinx.ext.autodoc.add_documenter() and AutoDirective._register is now deprecated. Please use app.add_autodocumenter() instead.
- AutoDirective._special_attrgetters is now deprecated. Please use app. add_autodoc_attrgetter() instead.

Features added

- C++, handle decltype(auto).
- #2406²⁶³⁰: C++, add proper parsing of expressions, including linking of identifiers.
- C++, add a cpp:expr role for inserting inline C++ expressions or types.
- C++, support explicit member instantiations with shorthand template prefix
- C++, make function parameters linkable, like template params.
- #3638²⁶³¹: Allow to change a label of reference to equation using math_eqref_format
- Now *suppress_warnings* accepts following configurations:
 - ref.python (ref: $#3866^{2632}$)
- #3872²⁶³³: Add latex key to configure literal blocks caption position in PDF output (refs #3792²⁶³⁴, #1723²⁶³⁵)
- In case of missing docstring try to retrieve doc from base classes (ref: #3140²⁶³⁶)
- #4023²⁶³⁷: Clarify error message when any role has more than one target.
- #3973²⁶³⁸: epub: allow to override build date

https://github.com/sphinx-doc/sphinx/issues/3973

- #3972²⁶³⁹: epub: Sort manifest entries by filename
- #4052²⁶⁴⁰: viewcode: Sort before highlighting module code
- #1448²⁶⁴¹: qthelp: Add new config value; qthelp_namespace
- #4140²⁶⁴²: html themes: Make body tag inheritable
- #4168²⁶⁴³: improve zh search with jieba
- HTML themes can set up default sidebars through theme.conf
- #3160²⁶⁴⁴: html: Use <kdb> to represent :kbd: role
- #4212²⁶⁴⁵: autosummary: catch all exceptions when importing modules
- #4166²⁶⁴⁶: Add math_numfig for equation numbering by section (refs: #3991²⁶⁴⁷, #4080²⁶⁴⁸). Thanks to Oliver Jahn.
- #4311²⁶⁴⁹: Let LaTeX obey numfig_secnum_depth for figures, tables, and code-blocks
- #947²⁶⁵⁰: autodoc now supports ignore-module-all to ignore a module's __all__
- #4332²⁶⁵¹: Let LaTeX obey math_numfig for equation numbering
- #4093²⁶⁵²: sphinx-build creates empty directories for unknown targets/builders
- Add top-classes option for the sphinx.ext.inheritance_diagram extension to limit the scope of inheritance graphs.
- #4183²⁶⁵³: doctest: :pyversion: option also follows PEP-440 specification
- #4235²⁶⁵⁴: html: Add manpages_url to make manpage roles to hyperlinks
- #3570²⁶⁵⁵: autodoc: Do not display 'typing.' module for type hints
- #4354²⁶⁵⁶: sphinx-build now emits finish message. Builders can modify it through Builder.epilog attribute
- #4245²⁶⁵⁷: html themes: Add language to javascript vars list
- #4079²⁶⁵⁸: html: Add notranslate class to each code-blocks, literals and maths to let Google Translate know they are not translatable
- #4137²⁶⁵⁹: doctest: doctest block is always highlighted as python console (pycon)
- #4137²⁶⁶⁰: doctest: testcode block is always highlighted as python

• #3998²⁶⁶¹: text: Assign section numbers by default. You can control it using text_add_secnumbers and text_secnumber_suffix

1.7.0b2

- #4271²⁶⁶²: sphinx-build supports an option called -j auto to adjust numbers of processes automatically.
- Napoleon: added option to specify custom section tags.

Features removed

- Configuration variables
 - html_use_smartypants
 - latex_keep_old_macro_names
 - latex_elements['footer']
- utility methods of sphinx.application.Sphinx class
 - buildername (property)
 - _display_chunk()
 - old_status_iterator()
 - status iterator()
 - _directive_helper()
- utility methods of sphinx.environment.BuildEnvironment class
 - currmodule (property)
 - currclass (property)
- epub2 builder
- prefix and colorfunc parameter for warn()
- sphinx.util.compat module
- sphinx.util.nodes.process_only_nodes()
- LaTeX environment notice, use sphinxadmonition instead
- LaTeX \sphinxstylethead, use \sphinxstyletheadfamily
- C++, support of function concepts. Thanks to mickk-on-cpp.
- Not used and previously not documented LaTeX macros \shortversion and \setshortversion

²⁶⁶¹ https://github.com/sphinx-doc/sphinx/issues/3998

²⁶⁶² https://github.com/sphinx-doc/sphinx/issues/4271

Bugs fixed

1.7.0b1

- #3882²⁶⁶³: Update the order of files for HTMLHelp and QTHelp
- #3962²⁶⁶⁴: sphinx-apidoc does not recognize implicit namespace packages correctly
- #4094²⁶⁶⁵: C++, allow empty template argument lists.
- C++, also hyperlink types in the name of declarations with qualified names.
- C++, do not add index entries for declarations inside concepts.
- C++, support the template disambiguator for dependent names.
- #4314²⁶⁶⁶: For PDF 'howto' documents, numbering of code-blocks differs from the one of figures and tables
- #4330²⁶⁶⁷: PDF 'howto' documents have an incoherent default LaTeX tocdepth counter setting
- #4198²⁶⁶⁸: autosummary emits multiple 'autodoc-process-docstring' event. Thanks to Joel Nothman.
- #4081²⁶⁶⁹: Warnings and errors colored the same when building
- latex: Do not display 'Release' label if release is not set

- #4415²⁶⁷⁰: autodoc classifies inherited classmethods as regular methods
- #4415²⁶⁷¹: autodoc classifies inherited staticmethods as regular methods
- #4472²⁶⁷²: DOCUMENTATION OPTIONS is not defined
- #4491²⁶⁷³: autodoc: prefer _MockImporter over other importers in sys.meta_path
- #4490²⁶⁷⁴: autodoc: type annotation is broken with python 3.7.0a4+
- utils package is no longer installed
- #3952²⁶⁷⁵: apidoc: module header is too escaped
- #4275²⁶⁷⁶: Formats accepted by sphinx.util.i18n.format date are limited
- #4493²⁶⁷⁷: recommonmark raises AttributeError if AutoStructify enabled
- #4209²⁶⁷⁸: intersphinx: In link title, "v" should be optional if target has no version
- #4230²⁶⁷⁹: slowdown in writing pages with Sphinx 1.6
- #4522²⁶⁸⁰: epub: document is not rebuilt even if config changed

1.7.0b3

- #4019²⁶⁸¹: inheritance_diagram AttributeError stopping make process
- #4531²⁶⁸²: autosummary: methods are not treated as attributes
- #4538²⁶⁸³: autodoc: sphinx.ext.autodoc.Options has been moved
- #4539²⁶⁸⁴: autodoc emits warnings for partialmethods
- #4223²⁶⁸⁵: doctest: failing tests reported in wrong file, at wrong line
- i18n: message catalogs are not compiled if specific filenames are given for sphinx-build as arguments (refs: #4560²⁶⁸⁶)
- #4027²⁶⁸⁷: sphinx.ext.autosectionlabel now expects labels to be the same as they are in the raw source; no smart quotes, nothig fancy.
- #4581²⁶⁸⁸: apidoc: Excluded modules still included

Testing

1.7.0b1

- Add support for Docutils 0.14
- Add tests for the sphinx.ext.inheritance_diagram extension.

14.101 Release 1.6.7 (released Feb 04, 2018)

- #1922²⁶⁸⁹: html search: Upper characters problem in French
- #4412²⁶⁹⁰: Updated jQuery version from 3.1.0 to 3.2.1
- #4438²⁶⁹¹: math: math with labels with whitespace cause html error
- #2437²⁶⁹²: make full reference for classes, aliased with "alias of"
- #4434²⁶⁹³: pure numbers as link targets produce warning
- #4477²⁶⁹⁴: Build fails after building specific files
- #4449²⁶⁹⁵: apidoc: include "empty" packages that contain modules

```

- #3917²⁶⁹⁶: citation labels are transformed to ellipsis
- #4501²⁶⁹⁷: graphviz: epub3 validation error caused if graph is not clickable
- #4514²⁶⁹⁸: graphviz: workaround for wrong map ID which graphviz generates
- #4525²⁶⁹⁹: autosectionlabel does not support parallel build
- #3953²⁷⁰⁰: Do not raise warning when there is a working intersphinx inventory
- #4487²⁷⁰¹: math: ValueError is raised on parallel build. Thanks to jschueller.
- #2372²⁷⁰²: autosummary: invalid signatures are shown for type annotated functions
- #3942²⁷⁰³: html: table is not aligned to center even if :align: center

14.102 Release 1.6.6 (released Jan 08, 2018)

Features added

- #4181²⁷⁰⁴: autodoc: Sort dictionary keys when possible
- VerbatimHighlightColor is a new *LaTeX* 'sphinxsetup' key (refs: #4285²⁷⁰⁵)
- Easier customizability of LaTeX macros involved in rendering of code-blocks
- Show traceback if conf.py raises an exception (refs: #4369²⁷⁰⁶)
- Add *smartquotes* to disable smart quotes through conf.py (refs: #3967²⁷⁰⁷)
- Add smartguotes_action and smartguotes_excludes (refs: #4142²⁷⁰⁸, #4357²⁷⁰⁹)

- #4334²⁷¹⁰: sphinx-apidoc: Don't generate references to non-existing files in TOC
- #4206²⁷¹¹: latex: reST label between paragraphs loses paragraph break
- #4231²⁷¹²: html: Apply fixFirefoxAnchorBug only under Firefox
- #4221²⁷¹³: napoleon depends on autodoc, but users need to load it manually
- #2298²⁷¹⁴: automodule fails to document a class attribute

²⁷¹⁴ https://github.com/sphinx-doc/sphinx/issues/2298

- #4099²⁷¹⁵: C++: properly link class reference to class from inside constructor
- #4267²⁷¹⁶: PDF build broken by Unicode U+2116 NUMERO SIGN character
- #4249²⁷¹⁷: PDF output: Pygments error highlighting increases line spacing in code blocks
- #1238²⁷¹⁸: Support :emphasize-lines: in PDF output
- #4279²⁷¹⁹: Sphinx crashes with pickling error when run with multiple processes and remote image
- #1421²⁷²⁰: Respect the quiet flag in sphinx-quickstart
- #4281²⁷²¹: Race conditions when creating output directory
- #4315²⁷²²: For PDF 'howto' documents, latex_toplevel_sectioning='part' generates \chapter commands
- #4214²⁷²³: Two todolist directives break Sphinx 1.6.5
- Fix links to external option does with intersphinx (refs: #3769²⁷²⁴)
- #4091²⁷²⁵: Private members not documented without :undoc-members:

14.103 Release 1.6.5 (released Oct 23, 2017)

Features added

- #4107²⁷²⁶: Make searchtools is compatible with pre-Sphinx 1.5 templates
- #4112²⁷²⁷: Don't override the smart_quotes setting if it was already set
- #4125²⁷²⁸: Display reference texts of original and translated passages on i18n warning message
- #4147²⁷²⁹: Include the exception when logging PO/MO file read/write

²⁷²⁹ https://github.com/sphinx-doc/sphinx/issues/4147

- #4085²⁷³⁰: Failed PDF build from image in parsed-literal using :align: option
- #4100²⁷³¹: Remove debug print from autodoc extension
- #3987²⁷³²: Changing theme from alabaster causes HTML build to fail
- #4096²⁷³³: C++, don't crash when using the wrong role type. Thanks to mitya57.
- #4070²⁷³⁴, #4111²⁷³⁵: crashes when the warning message contains format strings (again)
- #4108²⁷³⁶: Search word highlighting breaks SVG images
- #3692²⁷³⁷: Unable to build HTML if writing .buildinfo failed
- #4152²⁷³⁸: HTML writer crashes if a field list is placed on top of the document
- #4063²⁷³⁹: Sphinx crashes when labeling directive . . todolist::
- #4134²⁷⁴⁰: [doc] docutils.conf is not documented explicitly
- #4169²⁷⁴¹: Chinese language doesn't trigger Chinese search automatically
- #1020²⁷⁴²: ext.todo todolist not linking to the page in pdflatex
- #3965²⁷⁴³: New quickstart generates wrong SPHINXBUILD in Makefile
- #3739²⁷⁴⁴: :module: option is ignored at content of pyobjects
- #4149²⁷⁴⁵: Documentation: Help choosing *latex_engine*
- #4090²⁷⁴⁶: [doc] latex_additional_files with extra LaTeX macros should not use .tex extension
- Failed to convert reST parser error to warning (refs: #4132²⁷⁴⁷)

14.104 Release 1.6.4 (released Sep 26, 2017)

Features added

• #3926²⁷⁴⁸; Add autodoc warningiserror to suppress the behavior of -W option during importing target modules on autodoc

Bugs fixed

- #3924²⁷⁴⁹: docname lost after dynamically parsing RST in extension
- #3946²⁷⁵⁰: Typo in sphinx.sty (this was a bug with no effect in default context)

and :rfc: does not supports default-role directive (refs: #3960²⁷⁵¹)

- #3960²⁷⁵²: default role = 'guilabel' not functioning
- Missing texinputs_win/Makefile to be used in latexpdf builder on windows.
- #4026²⁷⁵³: nature: Fix macOS Safari scrollbar color
- #3877²⁷⁵⁴: Fix for C++ multiline signatures.
- #4006²⁷⁵⁵: Fix crash on parallel build
- #3969²⁷⁵⁶: private instance attributes causes AttributeError
- #4041²⁷⁵⁷: C++, remove extra name linking in function pointers.
- #4038²⁷⁵⁸: C, add missing documentation of member role.
- #4044²⁷⁵⁹: An empty multicolumn cell causes extra row height in PDF output
- #4049²⁷⁶⁰: Fix typo in output of sphinx-build -h
- #4062²⁷⁶¹: hashlib.sha1() must take bytes, not unicode on Python 3
- Avoid indent after index entries in latex (refs: #4066²⁷⁶²)
- #4070²⁷⁶³: crashes when the warning message contains format strings
- #4067²⁷⁶⁴: Return non-zero exit status when make subprocess fails
- #4055²⁷⁶⁵: graphviz: the :align: option does not work for SVG output

²⁷⁶⁴ https://github.com/sphinx-doc/sphinx/issues/4067

²⁷⁶⁵ https://github.com/sphinx-doc/sphinx/issues/4055

- #4055²⁷⁶⁶: graphviz: the :align: center option does not work for latex output
- #4051²⁷⁶⁷: warn() function for HTML theme outputs 'None' string

14.105 Release 1.6.3 (released Jul 02, 2017)

Features added

• latex: hint that code-block continues on next page (refs: #3764²⁷⁶⁸, #3792²⁷⁶⁹)

- #3821²⁷⁷⁰: Failed to import sphinx.util.compat with Docutils 0.14rc1
- #3829²⁷⁷¹: sphinx-quickstart template is incomplete regarding use of alabaster
- #3772²⁷⁷²: 'str object' has no attribute 'filename'
- Emit wrong warnings if citation label includes hyphens (refs: #3565²⁷⁷³)
- #3858²⁷⁷⁴: Some warnings are not colored when using –color option
- #3775²⁷⁷⁵: Remove unwanted whitespace in default template
- #3835²⁷⁷⁶: sphinx.ext.imgmath fails to convert SVG images if project directory name contains spaces
- #3850²⁷⁷⁷: Fix color handling in make mode's help command
- #3865²⁷⁷⁸: use of self.env.warn in Sphinx extension fails
- #3824²⁷⁷⁹: production lists apply smart quotes transform since Sphinx 1.6.1
- latex: fix \sphinxbfcode swallows initial space of argument
- #3878²⁷⁸⁰: Quotes in auto-documented class attributes should be straight quotes in PDF output
- #3881²⁷⁸¹: LaTeX figure floated to next page sometimes leaves extra vertical whitespace
- #3885²⁷⁸²: duplicated footnotes raises IndexError
- #3873²⁷⁸³: Failure of deprecation warning mechanism of sphinx.util.compat.Directive
- #3874²⁷⁸⁴: Bogus warnings for "citation not referenced" for cross-file citations

²⁷⁸³ https://github.com/sphinx-doc/sphinx/issues/3873

https://github.com/sphinx-doc/sphinx/issues/3874

- #3860²⁷⁸⁵: Don't download images when builders not supported images
- #3860²⁷⁸⁶: Remote image URIs without filename break builders not supported remote images
- #3833²⁷⁸⁷: command line messages are translated unintentionally with language setting.
- #3840²⁷⁸⁸: make checking epub_uid strict
- #3851²⁷⁸⁹, #3706²⁷⁹⁰: Fix about box drawing characters for PDF output
- #3900²⁷⁹¹: autosummary could not find methods
- #3902²⁷⁹²: Emit error if latex_documents contains non-unicode string in py2

14.106 Release 1.6.2 (released May 28, 2017)

Incompatible changes

• #3789²⁷⁹³: Do not require typing module for python>=3.5

Bugs fixed

- #3754²⁷⁹⁴: HTML builder crashes if HTML theme appends own stylesheets
- #3756²⁷⁹⁵: epub: Entity 'mdash' not defined
- #3758²⁷⁹⁶: Sphinx crashed if logs are emitted in conf.py
- #3755²⁷⁹⁷: incorrectly warns about dedent with literalinclude
- #3742²⁷⁹⁸: RTD²⁷⁹⁹ PDF builds of Sphinx own docs are missing an index entry in the bookmarks and table of contents. This is rtfd/readthedocs.org`#2857²⁸⁰⁰ https://github.com/rtfd/readthedocs.org/issues/2857 issue, a workaround is obtained using some extra LaTeX code in Sphinx's own conf.py
- #3770²⁸⁰¹: Build fails when a "code-block" has the option emphasize-lines and the number indicated is higher than the number of lines
- #3774²⁸⁰²: Incremental HTML building broken when using citations
- #3763²⁸⁰³: got epubcheck validations error if epub_cover is set

2803 https://github.com/sphinx-doc/sphinx/issues/3763

- #3779²⁸⁰⁴: 'ImportError' in sphinx.ext.autodoc due to broken 'sys.meta_path'. Thanks to Tatiana Tereshchenko.
- #3796²⁸⁰⁵: env.resolve_references() crashes when non-document node given
- #3803²⁸⁰⁶: Sphinx crashes with invalid PO files
- #3791²⁸⁰⁷: PDF "continued on next page" for long tables isn't internationalized
- #3788²⁸⁰⁸: smartquotes emits warnings for unsupported languages
- #3807²⁸⁰⁹: latex Makefile for make latexpdf is only for unixen
- #3781²⁸¹⁰: double hyphens in option directive are compiled as endashes
- #3817²⁸¹¹: latex builder raises AttributeError

14.107 Release 1.6.1 (released May 16, 2017)

Dependencies

1.6b1

- (updated) latex output is tested with Ubuntu trusty's texlive packages (Feb. 2014) and earlier tex installations may not be fully compliant, particularly regarding Unicode engines xelatex and lualatex
- (added) latexmk is required for make latexpdf on GNU/Linux and Mac OS X (refs: #3082²⁸¹²)

Incompatible changes

1.6b1

- #1061²⁸¹³, #2336²⁸¹⁴, #3235²⁸¹⁵: Now generation of autosummary doesn't contain imported members by default. Thanks to Luc Saffre.
- LaTeX \includegraphics command isn't overloaded: only \sphinxincludegraphics has the custom code to fit image to available width if oversized.
- The subclasses of sphinx.domains.Index should override generate() method. The default implementation raises NotImplementedError
- LaTeX positioned long tables horizontally centered, and short ones flushed left (no text flow around table.) The position now defaults to center in both cases, and it will obey Docutils 0.13 :align: option (refs #3415²⁸¹⁶, #3377²⁸¹⁷)
- option directive also allows all punctuations for the option name (refs: #3366²⁸¹⁸)

- #3413²⁸¹⁹: if *literalinclude*'s :start-after: is used, make :lines: relative (refs #3412²⁸²⁰)
- literalinclude directive does not allow the combination of :diff: option and other options (refs: #3416²⁸²¹)
- LuaLaTeX engine uses fontspec like XeLaTeX. It is advised latex_engine = 'lualatex' be used only on up-to-date TeX installs (refs #3070²⁸²², #3466²⁸²³)
- latex_keep_old_macro_names default value has been changed from True to False. This means that some LaTeX macros for styling are by default defined only with \sphinx.. prefixed names. (refs: #3429²⁸²⁴)
- Footer "Continued on next page" of LaTeX longtable's now not framed (refs: #3497²⁸²⁵)
- #3529²⁸²⁶: The arguments of BuildEnvironment.__init__ is changed
- #3082²⁸²⁷: Use latexmk for pdf (and dvi) targets (Unix-like platforms only)
- #3558²⁸²⁸: Emit warnings if footnotes and citations are not referenced. The warnings can be suppressed by suppress_warnings.
- latex made available (non documented) colour macros from a file distributed with pdftex engine for Plain TeX. This is removed in order to provide better support for multiple TeX engines. Only interface from color or xcolor packages should be used by extensions of Sphinx latex writer. (refs #3550²⁸²⁹)
- Builder.env is not filled at instantiation
- #3594²⁸³⁰: LaTeX: single raw directive has been considered as block level element
- #3639²⁸³¹: If html_experimental_html5_writer is available, epub builder use it by default.
- Sphinx.add_source_parser() raises an error if duplicated

1.6b2

• #3345²⁸³²: Replace the custom smartypants code with Docutils' smart_quotes. Thanks to Dmitry Shachnev, and to Günter Milde at Docutils.

1.6b3

- LaTeX package eqparbox is not used and not loaded by Sphinx anymore
- LaTeX package multirow is not used and not loaded by Sphinx anymore
- Add line numbers to citation data in std domain

1.6 final

• LaTeX package threeparttable is not used and not loaded by Sphinx anymore (refs #3686²⁸³³, #3532²⁸³⁴, #3377²⁸³⁵)

Features removed

- · Configuration variables
 - epub3_contributor
 - epub3_description
 - epub3_page_progression_direction
 - html_translator_class
 - html_use_modindex
 - latex font size
 - latex_paper_size
 - latex_preamble
 - latex_use_modindex
 - latex_use_parts
- termsep node
- · defindex.html template
- LDML format support in today, today_fmt and html_last_updated_fmt
- :inline: option for the directives of sphinx.ext.graphviz extension
- sphinx.ext.pngmath extension
- sphinx.util.compat.make_admonition()

Features added

1.6b1

- #3136²⁸³⁶: Add :name: option to the directives in sphinx.ext.graphviz
- #2336²⁸³⁷: Add imported_members option to sphinx-autogen command to document imported members.
- C++, add :tparam-line-spec: option to templated declarations. When specified, each template parameter will be rendered on a separate line.
- #3359²⁸³⁸: Allow sphinx.js in a user locale dir to override sphinx.js from Sphinx
- #3303²⁸³⁹: Add :pyversion: option to the doctest directive.
- #3378²⁸⁴⁰: (latex) support for :widths: option of table directives (refs: #3379²⁸⁴¹, #3381²⁸⁴²)
- #3402²⁸⁴³: Allow to suppress "download file not readable" warnings using *suppress_warnings*.
- #3377²⁸⁴⁴: latex: Add support for Docutils 0.13 :align: option for tables (but does not implement text flow around table).

https://github.com/sphinx-doc/sphinx/issues/3361 https://github.com/sphinx-doc/sphinx/issues/3402

²⁸⁴⁴ https://github.com/sphinx-doc/sphinx/issues/3377

- latex: footnotes from inside tables are hyperlinked (except from captions or headers) (refs: #3422²⁸⁴⁵)
- Emit warning if over dedent has detected on literalinclude directive (refs: #3416²⁸⁴⁶)
- Use for LuaLaTeX same default settings as for XeLaTeX (i.e. fontspec and polyglossia). (refs: #3070²⁸⁴⁷, #3466²⁸⁴⁸)
- Make 'extraclassoptions' key of latex_elements public (refs #3480²⁸⁴⁹)
- #3463²⁸⁵⁰: Add warning messages for required EPUB3 metadata. Add default value to epub_description to avoid warning like other settings.
- #3476²⁸⁵¹: setuptools: Support multiple builders
- latex: merged cells in LaTeX tables allow code-blocks, lists, blockquotes... as do normal cells (refs: #3435²⁸⁵²)
- HTML builder uses experimental HTML5 writer if html_experimental_html5_writer is True and Docutils 0.13 or later is installed.
- LaTeX macros to customize space before and after tables in PDF output (refs #3504²⁸⁵³)
- #3348²⁸⁵⁴: Show decorators in literalinclude and viewcode directives
- #3108²⁸⁵⁵: Show warning if :start-at: and other literalinclude options does not match to the text
- #3609²⁸⁵⁶: Allow to suppress "duplicate citation" warnings using suppress_warnings
- #2803²⁸⁵⁷: Discovery of builders by entry point
- #1764²⁸⁵⁸, #1676²⁸⁵⁹: Allow setting 'rel' and 'title' attributes for stylesheets
- #3589²⁸⁶⁰: Support remote images on non-HTML builders
- #3589²⁸⁶¹: Support images in Data URI on non-HTML builders
- #2961²⁸⁶²: improve autodoc_mock_imports. Now the config value only requires to declare the top-level modules that should be mocked. Thanks to Robin Jarry.
- #3449²⁸⁶³: On py3, autodoc use inspect.signature for more accurate signature calculation. Thanks to Nathaniel J. Smith.
- #3641²⁸⁶⁴: Epub theme supports HTML structures that are generated by HTML5 writer.
- #3644²⁸⁶⁵ autodoc uses inspect instead of checking types. Thanks to Jeroen Demeyer.

```

- Add a new extension; sphinx.ext.imgconverter. It converts images in the document to appropriate format
 for builders
- latex: Use templates to render tables (refs #3389²⁸⁶⁶, 2a37b0e)

1.6b2

- LATEXMKOPTS variable for the Makefile in \$BUILDDIR/latex to pass options to latexmk when executing make latexpdf (refs #3695²⁸⁶⁷, #3720²⁸⁶⁸)
- Add a new event env-check-consistency to check consistency to extensions
- Add Domain.check_consistency() to check consistency

Bugs fixed

1.6b1

- literalinclude directive expands tabs after dedent-ing (refs: #3416²⁸⁶⁹)
- #1574²⁸⁷⁰: Paragraphs in table cell doesn't work in Latex output
- #3288²⁸⁷¹: Table with merged headers not wrapping text
- #3491²⁸⁷²: Inconsistent vertical space around table and longtable in PDF
- \bullet #3506²⁸⁷³: Depart functions for all admonitions in HTML writer now properly pass node to depart_admonition.
- #2693²⁸⁷⁴: Sphinx latex style file wrongly inhibits colours for section headings for latex+dvi(ps,pdf,pdfmx)
- C++, properly look up any references.
- #3624²⁸⁷⁵: sphinx.ext.intersphinx couldn't load inventories compressed with gzip
- #3551²⁸⁷⁶: PDF information dictionary is lacking author and title data
- #3351²⁸⁷⁷: intersphinx does not refers context like py:module, py:class and so on.
- Fail to load template file if the parent template is archived

1.6b2

- #3661²⁸⁷⁸: sphinx-build crashes on parallel build
- #3669²⁸⁷⁹: gettext builder fails with "ValueError: substring not found"
- #3660²⁸⁸⁰: Sphinx always depends on sphinxcontrib-websupport and its dependencies

²⁸⁸⁰ https://github.com/sphinx-doc/sphinx/issues/3660

• #3472²⁸⁸¹: smart quotes getting wrong in latex (at least with list of strings via autoattribute) (refs: #3345²⁸⁸², #3666²⁸⁸³)

1.6b3

- #3588²⁸⁸⁴: No compact (p tag) html output in the i18n document build even when html_compact_lists is True.
- The make latexpdf from 1.6b1 (for GNU/Linux and Mac OS, using latexmk) aborted earlier in case of LaTeX errors than was the case with 1.5 series, due to hard-coded usage of --halt-on-error option (refs #3695²⁸⁸⁵)
- #3683²⁸⁸⁶: sphinx.websupport module is not provided by default
- #3683²⁸⁸⁷: Failed to build document if builder.css_file.insert() is called
- #3714²⁸⁸⁸: viewcode extension not taking highlight_code='none' in account
- #3698²⁸⁸⁹: Moving :doc: to std domain broke backwards compatibility
- #3633²⁸⁹⁰: misdetect unreferenced citations

1.6 final

- LaTeX tables do not allow multiple paragraphs in a header cell
- LATEXOPTS is not passed over correctly to pdflatex since 1.6b3
- #3532²⁸⁹¹: Figure or literal block captions in cells of short tables cause havoc in PDF output
- Fix: in PDF captions of tables are rendered differently whether table is of longtable class or not (refs #3686²⁸⁹²)
- #3725²⁸⁹³: Todo looks different from note in LaTeX output
- #3479²⁸⁹⁴: stub-columns have no effect in LaTeX output
- #3738²⁸⁹⁵: Nonsensical code in theming.py
- #3746²⁸⁹⁶: PDF builds fail with latexmk 4.48 or earlier due to undefined options -pdfxe and -pdflua

Deprecated

1.6b1

- sphinx.util.compat.Directive class is now deprecated. Please use instead docutils.parsers.rst. Directive
- sphinx.util.compat.docutils_version is now deprecated
- #2367²⁸⁹⁷: Sphinx.warn(), Sphinx.info() and other logging methods are now deprecated. Please use sphinx.util.logging (*Logging API*) instead.
- #3318²⁸⁹⁸: notice is now deprecated as LaTeX environment name and will be removed at Sphinx 1.7. Extension authors please use sphinxadmonition instead (as Sphinx does since 1.5.)
- Sphinx.status_iterator() and Sphinx.old_status_iterator() is now deprecated. Please use sphinx.util:status_iterator() instead.
- Sphinx._directive_helper() is deprecated. Please use sphinx.util.docutils.directive_helper() instead.
- BuildEnvironment.set_warnfunc() is now deprecated
- Following methods of BuildEnvironment is now deprecated.
 - BuildEnvironment.note_toctree()
 - BuildEnvironment.get_toc_for()
 - BuildEnvironment.get_toctree_for()
 - BuildEnvironment.create_index()

Please use sphinx.environment.adapters modules instead.

- latex package footnote is not loaded anymore by its bundled replacement footnotehyper-sphinx. The redefined macros keep the same names as in the original package.
- #3429²⁸⁹⁹: deprecate config setting latex_keep_old_macro_names. It will be removed at 1.7, and already its default value has changed from True to False.
- #3221²⁹⁰⁰: epub2 builder is deprecated
- #3254²⁹⁰¹: sphinx.websupport is now separated into independent package; sphinxcontrib-websupport. sphinx.websupport will be removed in Sphinx 2.0.
- #3628²⁹⁰²: sphinx_themes entry_point is deprecated. Please use sphinx.html_themes instead.

1.6b2

• #3662²⁹⁰³: builder.css_files is deprecated. Please use add_stylesheet() API instead.

1.6 final

• LaTeX \sphinxstylethead is deprecated at 1.6 and will be removed at 1.7. Please move customization into new macro \sphinxstyletheadfamily.

Testing

1.6 final

• #3458²⁹⁰⁴: Add sphinx.testing (experimental)

14.108 Release 1.6 (unreleased)

• not released (because of package script error)

14.109 Release 1.5.6 (released May 15, 2017)

- #3614²⁹⁰⁵: Sphinx crashes with requests-2.5.0
- #3618²⁹⁰⁶: autodoc crashes with tupled arguments
- #3664²⁹⁰⁷: No space after the bullet in items of a latex list produced by Sphinx
- #3657²⁹⁰⁸: EPUB builder crashes if a document starting with genindex exists
- #3588²⁹⁰⁹: No compact (p tag) html output in the i18n document build even when html_compact_lists is True.
- #3685²⁹¹⁰: AttributeError when using 3rd party domains
- #3702²⁹¹¹: LaTeX writer styles figure legends with a hard-coded \small
- #3708²⁹¹²: LaTeX writer allows irc scheme
- #3717²⁹¹³: Stop enforcing that favicon's must be .ico
- #3731²⁹¹⁴, #3732²⁹¹⁵: Protect isenumclass predicate against non-class arguments
- #3320²⁹¹⁶: Warning about reference target not being found for container types
- Misspelled ARCHIVEPREFIX in Makefile for latex build repertory

²⁹¹⁶ https://github.com/sphinx-doc/sphinx/issues/3320

14.110 Release 1.5.5 (released Apr 03, 2017)

Bugs fixed

- #3597²⁹¹⁷: python domain raises UnboundLocalError if invalid name given
- #3599²⁹¹⁸: Move to new MathJax CDN

14.111 Release 1.5.4 (released Apr 02, 2017)

Features added

• #3470²⁹¹⁹: Make genindex support all kinds of letters, not only Latin ones

- #3445²⁹²⁰: setting 'inputenc' key to \\usepackage[utf8x]{inputenc} leads to failed PDF build
- EPUB file has duplicated nav.xhtml link in content.opf except first time build
- #3488²⁹²¹: objects.inv has broken when release or version contain return code
- #2073²⁹²², #3443²⁹²³, #3490²⁹²⁴: gettext builder that writes pot files unless the content are same without creation date. Thanks to Yoshiki Shibukawa.
- #3487²⁹²⁵: intersphinx: failed to refer options
- #3496²⁹²⁶: latex longtable's last column may be much wider than its contents
- #3507²⁹²⁷: wrong quotes in latex output for productionlist directive
- #3533²⁹²⁸: Moving from Sphinx 1.3.1 to 1.5.3 breaks LaTeX compilation of links rendered as code
- #2665²⁹²⁹, #2607²⁹³⁰: Link names in C++ docfields, and make it possible for other domains.
- #3542²⁹³¹: C++, fix parsing error of non-type template argument with template.
- #3065²⁹³², #3520²⁹³³: python domain fails to recognize nested class

²⁹³² https://github.com/sphinx-doc/sphinx/issues/3065

²⁹³³ https://github.com/sphinx-doc/sphinx/issues/3520

- #3575²⁹³⁴: Problems with pdflatex in a Turkish document built with Sphinx has reappeared (refs #2997²⁹³⁵, $#2397^{2936}$)
- #3577²⁹³⁷: Fix intersphinx debug tool
- A LaTeX command such as \\large inserted in the title items of latex_documents causes failed PDF build (refs #3551²⁹³⁸, #3567²⁹³⁹)

14.112 Release 1.5.3 (released Feb 26, 2017)

Features added

- Support requests-2.0.0 (experimental) (refs: #3367²⁹⁴⁰)
- (latex) PDF page margin dimensions may be customized (refs: #3387²⁹⁴¹)
- literalinclude directive allows combination of :pyobject; and :lines; options (refs: #3416²⁹⁴²)
- #3400²⁹⁴³: make-mode doesn't use subprocess on building docs

- #3370²⁹⁴⁴: the caption of code-block is not picked up for translation
- LaTeX: release is not escaped (refs: #3362²⁹⁴⁵)
- #3364²⁹⁴⁶: sphinx-quickstart prompts overflow on Console with 80 chars width
- since 1.5, PDF's TOC and bookmarks lack an entry for general Index (refs: #3383²⁹⁴⁷)
- #3392²⁹⁴⁸: 'releasename' in *latex elements* is not working
- #3356²⁹⁴⁹: Page layout for Japanese 'manual' docclass has a shorter text area
- #3394²⁹⁵⁰: When 'pointsize' is not 10pt, Japanese 'manual' document gets wrong PDF page dimensions
- #3399²⁹⁵¹: quickstart: conf.pv was not overwritten by template
- #3366²⁹⁵²: option directive does not allow punctuations
- #3410²⁹⁵³: return code in *release* breaks html search

- #3427²⁹⁵⁴: autodoc: memory addresses are not stripped on Windows
- #3428²⁹⁵⁵: xetex build tests fail due to fontspec v2.6 defining \strong
- #3349²⁹⁵⁶: Result of IndexBuilder.load() is broken
- #3450²⁹⁵⁷: is appeared in EPUB docs
- #3418²⁹⁵⁸: Search button is misaligned in nature and pyramid theme
- #3421²⁹⁵⁹: Could not translate a caption of tables
- #3552²⁹⁶⁰: linkcheck raises UnboundLocalError

14.113 Release 1.5.2 (released Jan 22, 2017)

Incompatible changes

• Dependency requirement updates: requests 2.4.0 or above (refs: #3268²⁹⁶¹, #3310²⁹⁶²)

Features added

- #3241²⁹⁶³: emit latex warning if buggy titlesec (ref #3210²⁹⁶⁴)
- #3194²⁹⁶⁵: Refer the \$MAKE environment variable to determine make command
- Emit warning for nested numbered toctrees (refs: #3142²⁹⁶⁶)
- #978²⁹⁶⁷: intersphinx_mapping also allows a list as a parameter
- #3340²⁹⁶⁸: (LaTeX) long lines in parsed-literal²⁹⁶⁹ are wrapped like in *code-block*, inline math and footnotes are fully functional.

²⁹⁶⁹ https://docutils.sourceforge.io/docs/ref/rst/directives.html#parsed-literal

²⁹⁶⁸ https://github.com/sphinx-doc/sphinx/issues/3340

- #3246²⁹⁷⁰: xapian search adapter crashes
- #3253²⁹⁷¹: In Py2 environment, building another locale with a non-captioned toctree produces None captions
- #185²⁹⁷²: References to section title including raw node has broken
- #3255²⁹⁷³: In Py3.4 environment, autodoc doesn't support documentation for attributes of Enum class correctly.
- #3261²⁹⁷⁴: latex_use_parts makes Sphinx crash
- The warning type misc.highlighting_failure does not work
- #3294²⁹⁷⁵: add_latex_package() make crashes non-LaTeX builders
- The caption of table are rendered as invalid HTML (refs: #3287²⁹⁷⁶)
- #3268²⁹⁷⁷: Sphinx crashes with requests package from Debian jessie
- #3284²⁹⁷⁸: Sphinx crashes on parallel build with an extension which raises unserializable exception
- #3315²⁹⁷⁹: Bibliography crashes on latex build with docclass 'memoir'
- #3328²⁹⁸⁰: Could not refer rubric implicitly
- #3329²⁹⁸¹: emit warnings if po file is invalid and can't read it. Also writing mo
- #3337²⁹⁸²: Ugly rendering of definition list term's classifier
- #3335²⁹⁸³: gettext does not extract field_name of a field in a field list
- #2952²⁹⁸⁴: C++, fix refs to operator() functions.
- Fix Unicode super- and subscript digits in *code-block* and parsed-literal LaTeX output (ref #3342²⁹⁸⁵)
- LaTeX writer: leave "character inside parsed-literal as is (ref #3341²⁹⁸⁶)
- #3234²⁹⁸⁷: intersphinx failed for encoded inventories
- #3158²⁹⁸⁸: too much space after captions in PDF output
- #3317²⁹⁸⁹: An URL in parsed-literal contents gets wrongly rendered in PDF if with hyphen
- LaTeX crash if the filename of an image inserted in parsed-literal via a substitution contains an hyphen (ref #3340²⁹⁹⁰)

- LaTeX rendering of inserted footnotes in parsed-literal is wrong (ref #3340²⁹⁹¹)
- Inline math in parsed-literal is not rendered well by LaTeX (ref #3340²⁹⁹²)
- #3308²⁹⁹³: Parsed-literals don't wrap very long lines with pdf builder (ref #3340²⁹⁹⁴)
- #3295²⁹⁹⁵: Could not import extension sphinx.builders.linkcheck
- #3285²⁹⁹⁶: autosummary: asterisks are escaped twice
- LaTeX, pass dvipdfm option to geometry package for Japanese documents (ref #3363²⁹⁹⁷)
- Fix parselinenos() could not parse left half open range (cf. "-4")

14.114 Release 1.5.1 (released Dec 13, 2016)

Features added

• #3214²⁹⁹⁸: Allow to suppress "unknown mimetype" warnings from epub builder using *suppress_warnings*.

- #3195²⁹⁹⁹: Can not build in parallel
- #3198³⁰⁰⁰: AttributeError is raised when toctree has 'self'
- #3211³⁰⁰¹: Remove untranslated Sphinx locale catalogs (it was covered by untranslated it_IT)
- #3212³⁰⁰²: HTML Builders crashes with Docutils 0.13
- #3207³⁰⁰³: more latex problems with references inside parsed-literal directive (\DUrole)
- #3205³⁰⁰⁴: sphinx.util.requests crashes with old pyOpenSSL (< 0.14)
- #3220³⁰⁰⁵: KeyError when having a duplicate citation
- #3200³⁰⁰⁶: LaTeX: xref inside desc name not allowed
- #3228³⁰⁰⁷: build_sphinx command crashes when missing dependency
- #2469³⁰⁰⁸: Ignore updates of catalog files for gettext builder. Thanks to Hiroshi Ohkubo.
- #3183³⁰⁰⁹: Randomized jump box order in generated index page.

14.115 Release 1.5 (released Dec 5, 2016)

Incompatible changes

1.5a1

- · latex, package fancybox is not any longer a dependency of sphinx.sty
- Use 'locales' as a default value of locale_dirs
- · latex, package ifthen is not any longer a dependency of sphinx.sty
- latex, style file does not modify fancyvrb's Verbatim (also available as OriginalVerbatim) but uses sphinxVerbatim for name of custom wrapper.
- latex, package newfloat is not used (and not included) anymore (ref #2660³⁰¹⁰; it was used since 1.3.4 and shipped with Sphinx since 1.4).
- latex, literal blocks in tables do not use OriginalVerbatim but sphinxVerbatimintable which handles captions and wraps lines (ref #2704³⁰¹¹).
- latex, replace pt by TeX equivalent bp if found in width or height attribute of an image.
- latex, if width or height attribute of an image is given with no unit, use px rather than ignore it.
- latex: Separate stylesheets of pygments to independent .sty file
- #2454³⁰¹²: The filename of sourcelink is now changed. The value of html_sourcelink_suffix will be appended to the original filename (like index.rst.txt).
- sphinx.util.copy_static_entry() is now deprecated. Use sphinx.util.fileutil.copy_asset() instead.
- sphinx.util.osutil.filecopy() skips copying if the file has not been changed (ref: #2510³⁰¹³, #2753³⁰¹⁴)
- Internet Explorer 6-8, Opera 12.1x or Safari 5.1+ support is dropped because jQuery version is updated from 1.11.0 to 3.1.0 (ref: #2634³⁰¹⁵, #2773³⁰¹⁶)
- QtHelpBuilder doesn't generate search page (ref: #2352³⁰¹⁷)
- QtHelpBuilder uses nonav theme instead of default one to improve readability.
- latex: To provide good default settings to Japanese documents, Sphinx uses jreport and jsbook as docclass if language is ja.
- sphinx-quickstart now allows a project version is empty
- Fix :download: role on epub/qthelp builder. They ignore the role because they don't support it.
- sphinx.ext.viewcode doesn't work on epub building by default. viewcode_enable_epub option
- sphinx.ext.viewcode disabled on singlehtml builder.
- Use make-mode of sphinx-quickstart by default. To disable this, use -M option
- Fix genindex.html, Sphinx's document template, link address to itself to satisfy xhtml standard.

³⁰¹⁰ https://github.com/sphinx-doc/sphinx/issues/2660

³⁰¹¹ https://github.com/sphinx-doc/sphinx/issues/2704

³⁰¹² https://github.com/sphinx-doc/sphinx/issues/2454

³⁰¹³ https://github.com/sphinx-doc/sphinx/issues/2510

³⁰¹⁴ https://github.com/sphinx-doc/sphinx/issues/2753

³⁰¹⁵ https://github.com/sphinx-doc/sphinx/issues/2634

³⁰¹⁶ https://github.com/sphinx-doc/sphinx/issues/2773

³⁰¹⁷ https://github.com/sphinx-doc/sphinx/issues/2352

- Use epub3 builder by default. And the old epub builder is renamed to epub2.
- Fix epub and epub3 builders that contained links to genindex even if epub_use_index = False.
- html_translator_class is now deprecated. Use set_translator() API instead.
- Drop python 2.6 and 3.3 support
- Drop epub3 builder's epub3_page_progression_direction option (use epub3_writing_mode).
- #2877³⁰¹⁸: Rename latex_elements['footer'] to latex_elements['atendofbody']

1.5a2

- #2983³⁰¹⁹: Rename epub3_description and epub3_contributor to epub_description and epub_contributor.
- Remove themes/basic/defindex.html; no longer used
- Sphinx does not ship anymore (but still uses) LaTeX style file fncychap
- #2435³⁰²⁰: Slim down quickstarted conf.py
- The sphinx.sty latex package does not load itself "hyperref", as this is done later in the preamble of the latex output via 'hyperref' key.
- Sphinx does not ship anymore a custom modified LaTeX style file tabulary. The non-modified package is used.
- #3057³⁰²¹: By default, footnote marks in latex PDF output are not preceded by a space anymore, \ sphinxBeforeFootnote allows user customization if needed.
- LaTeX target requires that option hyperfootnotes of package hyperref be left unchanged to its default (i.e. true) (refs: #3022³⁰²²)

1.5 final

- #2986³⁰²³: themes/basic/defindex.html is now deprecated
- Emit warnings that will be deprecated in Sphinx 1.6 by default. Users can change the behavior by setting the environment variable PYTHONWARNINGS. Please refer *Deprecation Warnings*.
- #2454³⁰²⁴: new JavaScript variable SOURCELINK_SUFFIX is added

Deprecated

These features are removed in Sphinx 1.6:

- LDML format support in i18n feature
- sphinx.addnodes.termsep
- Some functions and classes in sphinx.util.pycompat: zip_longest, product, all, any, next, open, class_types, base_exception, relpath, StringIO, BytesIO. Please use the standard library version instead;

If any deprecation warning like RemovedInSphinxXXXWarning are displayed, please refer Deprecation Warnings.

³⁰²³ https://github.com/sphinx-doc/sphinx/issues/2986

³⁰²⁴ https://github.com/sphinx-doc/sphinx/issues/2454

Features added

1.5a1

- #2951³⁰²⁵: Add --implicit-namespaces PEP-0420 support to apidoc.
- Add :caption: option for sphinx.ext.inheritance_diagram.
- #2471³⁰²⁶: Add config variable for default doctest flags.
- · Convert linkcheck builder to requests for better encoding handling
- #2463³⁰²⁷, #2516³⁰²⁸: Add keywords of "meta" directive to search index
- :maxdepth: option of toctree affects secnumdepth (ref: #2547³⁰²⁹)
- #25753030: Now sphinx.ext.graphviz allows:align: option
- Show warnings if unknown key is specified to latex_elements
- Show warnings if no domains match with *primary_domain* (ref: #2001³⁰³¹)
- C++, show warnings when the kind of role is misleading for the kind of target it refers to (e.g., using the *class* role for a function).
- latex, writer abstracts more of text styling into customizable macros, e.g. the visit_emphasis will output \ sphinxstyleemphasis rather than \emph (which may be in use elsewhere or in an added LaTeX package). See list at end of sphinx.sty (ref: #2686³⁰³²)
- latex, public names for environments and parameters used by note, warning, and other admonition types, allowing full customizability from the 'preamble' key or an input file (ref: feature request #2674³⁰³³, #2685³⁰³⁴)
- latex, better computes column widths of some tables (as a result, there will be slight changes as tables now correctly fill the line width; ref: #2708³⁰³⁵)
- latex, sphinxVerbatim environment is more easily customizable (ref: #2704³⁰³⁶). In addition to already existing VerbatimColor and VerbatimBorderColor:
 - two lengths \sphinxverbatimsep and \sphinxverbatimborder,
 - booleans \ifsphinxverbatimwithframe and \ifsphinxverbatimwrapslines.
- latex, captions for literal blocks inside tables are handled, and long code lines wrapped to fit table cell (ref: #2704³⁰³⁷)
- #2597³⁰³⁸: Show warning messages as darkred
- latex, allow image dimensions using px unit (default is 96px=1in)
- · Show warnings if invalid dimension units found
- #2650³⁰³⁹: Add --pdb option to setup.py command

```

³⁰³⁷ https://github.com/sphinx-doc/sphinx/issues/2704

³⁰³⁸ https://github.com/sphinx-doc/sphinx/issues/2597

³⁰³⁹ https://github.com/sphinx-doc/sphinx/issues/2650

- latex, make the use of \small for code listings customizable (ref #2721³⁰⁴⁰)
- #2663³⁰⁴¹: Add --warning-is-error option to setup.py command
- · Show warnings if deprecated latex options are used
- Add sphinx.config.ENUM to check the config values is in candidates
- math: Add hyperlink marker to each equations in HTML output
- Add new theme nonav that doesn't include any navigation links. This is for any help generator like qthelp.
- #2680³⁰⁴²: sphinx.ext.todo now emits warnings if todo_emit_warnings enabled. Also, it emits an additional event named todo-defined to handle the TODO entries in 3rd party extensions.
- Python domain signature parser now uses the xref mixin for 'exceptions', allowing exception classes to be autolinked.
- #2513³⁰⁴³: Add *latex_engine* to switch the LaTeX engine by conf.py
- #2682³⁰⁴⁴: C++, basic support for attributes (C++11 style and GNU style). The new configuration variables 'cpp_id_attributes' and 'cpp_paren_attributes' can be used to introduce custom attributes.
- #1958³⁰⁴⁵: C++, add configuration variable 'cpp index common prefix' for removing prefixes from the index text of C++ objects.
- C++, added concept directive. Thanks to mickk-on-cpp.
- C++, added support for template introduction syntax. Thanks to mickk-on-cpp.
- #2725³⁰⁴⁶: latex builder: allow to use user-defined template file (experimental)
- · apidoc now avoids invalidating cached files by not writing to files whose content doesn't change. This can lead to significant performance wins if apidoc is run frequently.
- #2851³⁰⁴⁷: sphinx.ext.math emits missing-reference event if equation not found
- #1210³⁰⁴⁸: egref role now supports cross reference
- #2892³⁰⁴⁹: Added -a (--append-syspath) option to sphinx-apidoc
- #1604³⁰⁵⁰: epub3 builder: Obey font-related CSS when viewing in iBooks.
- #646³⁰⁵¹: option directive support '.' character as a part of options
- Add document about kindlegen and fix document structure for it.
- #2474³⁰⁵²: Add intersphinx_timeout option to sphinx.ext.intersphinx
- #2926³⁰⁵³: EPUB3 builder supports vertical mode (epub3_writing_mode option)
- #2695³⁰⁵⁴: build_sphinx subcommand for setuptools handles exceptions as same as sphinx-build does

³⁰⁵⁴ https://github.com/sphinx-doc/sphinx/issues/2695

- #326³⁰⁵⁵: numref role can also refer sections
- #2916³⁰⁵⁶: numref role can also refer caption as an its linktext

1.5a2

- #3008³⁰⁵⁷: linkcheck builder ignores self-signed certificate URL
- #3020³⁰⁵⁸: new 'geometry' key to latex_elements whose default uses LaTeX style file geometry.sty to set page layout
- #2843³⁰⁵⁹: Add :start-at: and :end-at: options to literalinclude directive
- #2527³⁰⁶⁰: Add :reversed: option to toctree directive
- Add -t and -d option to sphinx-quickstart to support templating generated Sphinx project.
- #3028³⁰⁶¹: Add {path} and {basename} to the format of figure_language_filename
- new 'hyperref' key in the latex_elements dictionary (ref #3030³⁰⁶²)
- #3022³⁰⁶³: Allow code-blocks in footnotes for LaTeX PDF output

1.5b1

- #2513³⁰⁶⁴: A better default settings for XeLaTeX
- #3096³⁰⁶⁵: 'maxlistdepth' key to work around LaTeX list limitations
- #3060³⁰⁶⁶: autodoc supports documentation for attributes of Enum class. Now autodoc render just the value of Enum attributes instead of Enum attribute representation.
- Add --extensions to sphinx-quickstart to support enable arbitrary extensions from command line (ref: $#2904^{3067}$)
- #3104³⁰⁶⁸, #3122³⁰⁶⁹: 'sphinxsetup' for key=value styling of Sphinx LaTeX
- #30713070: Autodoc: Allow mocked module decorators to pass-through functions unchanged
- #2495³⁰⁷¹: linkcheck: Allow skipping anchor checking using linkcheck_anchors_ignore
- $#3083^{3072}$: let Unicode no-break space act like LaTeX ~ (fixed $#3019^{3073}$)
- #3116³⁰⁷⁴: allow word wrap in PDF output for inline literals (ref #3110³⁰⁷⁵)
- #930³⁰⁷⁶: sphinx-apidoc allow wildcards for excluding paths. Thanks to Nick Coghlan.

• #31213077; add inlineliteralwraps option to control if inline literal word-wraps in latex

1.5 final

- #3095³⁰⁷⁸: Add tls_verify and tls_cacerts to support self-signed HTTPS servers in linkcheck and intersphinx
- #2215³⁰⁷⁹: make.bat generated by sphinx-quickstart can be called from another dir. Thanks to Timotheus Kampik.
- #3185³⁰⁸⁰: Add new warning type misc.highlighting failure

Bugs fixed

1.5a1

- #2707³⁰⁸¹: (latex) the column width is badly computed for tabular
- #2799³⁰⁸²: Sphinx installs roles and directives automatically on importing sphinx module. Now Sphinx installs them on running application.
- sphinx.ext.autodoc crashes if target code imports * from mock modules by autodoc_mock_imports.
- #1953³⁰⁸³: Sphinx.add_node does not add handlers the translator installed by html_translator_class
- #1797³⁰⁸⁴: text builder inserts blank line on top
- #2894³⁰⁸⁵: quickstart main() doesn't use argy argument
- #2874³⁰⁸⁶: gettext builder could not extract all text under the only directives
- #2485³⁰⁸⁷: autosummary crashes with multiple source suffix values
- #1734³⁰⁸⁸: Could not translate the caption of toctree directive
- Could not translate the content of meta directive (ref: #1734³⁰⁸⁹)
- #2550³⁰⁹⁰: external links are opened in help viewer
- #2687³⁰⁹¹: Running Sphinx multiple times produces 'already registered' warnings

1.5a2

- #2810³⁰⁹²: Problems with pdflatex in an Italian document
- Use latex_elements.papersize to specify papersize of LaTeX in Makefile
- #2988³⁰⁹³: linkcheck: retry with GET request if denied HEAD request

- #2990³⁰⁹⁴: linkcheck raises "Can't convert 'bytes' object to str implicitly" error if linkcheck anchors enabled
- #3004³⁰⁹⁵: Invalid link types "top" and "up" are used
- #3009³⁰⁹⁶: Bad rendering of parsed-literals in LaTeX since Sphinx 1.4.4
- #3000³⁰⁹⁷: option directive generates invalid HTML anchors
- #2984³⁰⁹⁸: Invalid HTML has been generated if html split index enabled
- #2986³⁰⁹⁹: themes/basic/defindex.html should be changed for html5 friendly
- #2987³¹⁰⁰: Invalid HTML has been generated if multiple IDs are assigned to a list
- #2891³¹⁰¹: HTML search does not provide all the results
- #1986³¹⁰²: Title in PDF Output
- #147³¹⁰³: Problem with latex chapter style
- #3018³¹⁰⁴: LaTeX problem with page layout dimensions and chapter titles
- Fix an issue with \pysigline in LaTeX style file (ref #3023³¹⁰⁵)
- #3038³¹⁰⁶: sphinx.ext.math* raises TypeError if labels are duplicated
- #3031³¹⁰⁷: incompatibility with LaTeX package tocloft
- #3003³¹⁰⁸: literal blocks in footnotes are not supported by Latex
- #3047³¹⁰⁹: spacing before footnote in pdf output is not coherent and allows breaks
- #3045³¹¹⁰: HTML search index creator should ignore "raw" content if now html
- #3039³¹¹¹: English stemmer returns wrong word if the word is capitalized
- Fix make-mode Makefile template (ref #3056³¹¹², #2936³¹¹³)

1.5b1

- #2432³¹¹⁴: Fix unwanted * between varargs and keyword only args. Thanks to Alex Grönholm.
- #30623115: Failed to build PDF using 1.5a2 (undefined \hypersetup for Japanese documents since PR#3030³¹¹⁶)
- Better rendering of multiline signatures in html.

14.116 Release 1.4.9 (released Nov 23, 2016)

Bugs fixed

- #2936³¹³⁶: Fix doc/Makefile that can't build man because doc/man exists
- #3058³¹³⁷: Using the same 'caption' attribute in multiple 'toctree' directives results in warning / error
- #3068³¹³⁸: Allow the '=' character in the -D option of sphinx-build.py
- #3074³¹³⁹: add_source_parser() crashes in debug mode
- #3135³¹⁴⁰: sphinx.ext.autodoc crashes with plain Callable
- #3150³¹⁴¹: Fix query word splitter in JavaScript. It behaves as same as Python's regular expression.
- #3093³¹⁴²: gettext build broken on substituted images.
- #3093³¹⁴³: gettext build broken on image node under note directive.
- imgmath: crashes on showing error messages if image generation failed
- #3117³¹⁴⁴: LaTeX writer crashes if admonition is placed before first section title
- #3164³¹⁴⁵: Change search order of sphinx.ext.inheritance_diagram

14.117 Release 1.4.8 (released Oct 1, 2016)

Bugs fixed

• #2996³¹⁴⁶: The wheel package of Sphinx got crash with ImportError

14.118 Release 1.4.7 (released Oct 1, 2016)

- #2890³¹⁴⁷: Quickstart should return an error consistently on all error conditions
- #2870³¹⁴⁸: flatten genindex columns' heights.
- #2856³¹⁴⁹: Search on generated HTML site doesn't find some symbols
- #2882³¹⁵⁰: Fall back to a GET request on 403 status in linkcheck

³¹⁴⁹ https://github.com/sphinx-doc/sphinx/issues/2856

³¹⁵⁰ https://github.com/sphinx-doc/sphinx/issues/2882

- #2902³¹⁵¹: jsdump.loads fails to load search index if keywords starts with underscore
- #2900³¹⁵²: Fix epub content.opf: add auto generated orphan files to spine.
- #2899³¹⁵³: Fix hasdoc() function in Jinja2 template. It will detect genindex, search also.
- #2901³¹⁵⁴: Fix epub result: skip creating links from image tags to original image files.
- #2917³¹⁵⁵: inline code is hyphenated on HTML
- #1462³¹⁵⁶: autosummary warns for namedtuple with attribute with trailing underscore
- Could not reference equations if :nowrap: option specified
- #2873³¹⁵⁷: code-block overflow in latex (due to commas)
- #1060³¹⁵⁸, #2056³¹⁵⁹: sphinx.ext.intersphinx: broken links are generated if relative paths are used in intersphinx_mapping
- #2931³¹⁶⁰: code-block directive with same :caption: causes warning of duplicate target. Now code-block and literalinclude does not define hyperlink target using its caption automatically.
- #2962³¹⁶¹: latex: missing label of longtable
- #2968³¹⁶²: autodoc: show-inheritance option breaks docstrings

14.119 Release 1.4.6 (released Aug 20, 2016)

Incompatible changes

• #2867³¹⁶³: linkcheck builder crashes with six-1.4. Now Sphinx depends on six-1.5 or later

- applehelp: Sphinx crashes if hiutil or codesign commands not found
- Fix make clean abort issue when build dir contains regular files like DS_Store.
- Reduce epubcheck warnings/errors:
 - Fix DOCTYPE to html5
 - Change extension from .html to .xhtml.
 - Disable search page on epub results
- #2778³¹⁶⁴: Fix autodoc crashes if obj.__dict__ is a property method and raises exception

³¹⁶³ https://github.com/sphinx-doc/sphinx/issues/2867

³¹⁶⁴ https://github.com/sphinx-doc/sphinx/issues/2778

- Fix duplicated toc in epub3 output.
- #2775³¹⁶⁵: Fix failing linkcheck with servers not supporting identity encoding
- #2833³¹⁶⁶: Fix formatting instance annotations in ext.autodoc.
- #1911³¹⁶⁷: -D option of sphinx-build does not override the extensions variable
- #2789³¹⁶⁸: sphinx.ext.intersphinx generates wrong hyperlinks if the inventory is given
- parsing errors for caption of code-blocks are displayed in document (ref: #2845³¹⁶⁹)
- #2846³¹⁷⁰: singlehtml builder does not include figure numbers
- #2816³¹⁷¹: Fix data from builds cluttering the Domain.initial_data class attributes

14.120 Release 1.4.5 (released Jul 13, 2016)

Incompatible changes

- latex, inclusion of non-inline images from image directive resulted in non-coherent whitespaces depending on original image width; new behaviour by necessity differs from earlier one in some cases. (ref: #2672³¹⁷²)
- latex, use of \includegraphics to refer to Sphinx custom variant is deprecated; in future it will revert to original LaTeX macro, custom one already has alternative name \sphinxincludegraphics.

Features added

- new config option latex_keep_old_macro_names, defaults to True. If False, lets macros (for text styling) be defined only with \sphinx-prefixed names
- latex writer allows user customization of "shadowed" boxes (topics), via three length variables.
- woff-format web font files now supported by the epub builder.

- jsdump fix for python 3: fixes the HTML search on python > 3
- #2676³¹⁷³: (latex) Error with verbatim text in captions since Sphinx 1.4.4
- #2629³¹⁷⁴: memoir class crashes LaTeX. Fixed by latex_keep_old_macro_names=False (ref 2675)
- #2684³¹⁷⁵: sphinx.ext.intersphinx crashes with six-1.4.1
- #2679³¹⁷⁶: float package needed for 'figure_align': 'H' latex option

³¹⁷⁴ https://github.com/sphinx-doc/sphinx/issues/2629

³¹⁷⁵ https://github.com/sphinx-doc/sphinx/issues/2684

³¹⁷⁶ https://github.com/sphinx-doc/sphinx/issues/2679

- #2671³¹⁷⁷: image directive may lead to inconsistent spacing in pdf
- #2705³¹⁷⁸: toctree generates empty bullet list if :titlesonly: specified
- #2479³¹⁷⁹: sphinx.ext.viewcode uses python2 highlighter by default
- #2700³¹⁸⁰: HtmlHelp builder has hard coded index.html
- latex, since 1.4.4 inline literal text is followed by spurious space
- #2722³¹⁸¹: C++, fix id generation for var/member declarations to include namespaces.
- · latex, images (from image directive) in lists or quoted blocks did not obey indentation (fixed together with $#2671^{3182}$)
- #2733³¹⁸³: since Sphinx 1.4.4 make latexpdf generates lots of hyperref warnings
- #2731³¹⁸⁴: sphinx.ext.autodoc does not access propertymethods which raises any exceptions
- #2666³¹⁸⁵: C++, properly look up nested names involving constructors.
- #2579³¹⁸⁶: Could not refer a label including both spaces and colons via *sphinx.ext.intersphinx*
- #2718³¹⁸⁷: Sphinx crashes if the document file is not readable
- #2699³¹⁸⁸: hyperlinks in help HTMLs are broken if html_file_suffix is set
- #2723³¹⁸⁹: extra spaces in latex pdf output from multirow cell
- #2735³¹⁹⁰: latexpdf Underfull \hbox (badness 10000) warnings from title page
- #2667³¹⁹¹: latex crashes if resized images appeared in section title
- #2763³¹⁹²: (html) Provide default value for required alt attribute for image tags of SVG source, required to validate and now consistent w/ other formats.

14.121 Release 1.4.4 (released Jun 12, 2016)

- #2630³¹⁹³: latex: sphinx.sty notice environment formatting problem
- #2632³¹⁹⁴: Warning directives fail in quote environment latex build
- #2633³¹⁹⁵: Sphinx crashes with old styled indices

- Fix a \begin{\minipage} typo in sphinx.sty from 1.4.2 (ref: 68becb1)
- #2622³¹⁹⁶: Latex produces empty pages after title and table of contents
- #2640³¹⁹⁷: 1.4.2 LaTeX crashes if code-block inside warning directive
- Let LaTeX use straight quotes also in inline code (ref #2627³¹⁹⁸)
- #2351³¹⁹⁹: latex crashes if enumerated lists are placed on footnotes
- #2646³²⁰⁰: latex crashes if math contains twice empty lines
- #2480³²⁰¹: sphinx.ext.autodoc: memory addresses were shown
- latex: allow code-blocks appearing inside lists and quotes at maximal nesting depth (ref #777³²⁰², #2624³²⁰³, #2651³²⁰⁴)
- #2635³²⁰⁵: Latex code directives produce inconsistent frames based on viewing resolution
- #2639³²⁰⁶: Sphinx now bundles iftex.sty
- Failed to build PDF with framed.sty 0.95
- Sphinx now bundles needspace.stv

14.122 Release 1.4.3 (released Jun 5, 2016)

- #2530³²⁰⁷: got "Counter too large" error on building PDF if large numbered footnotes existed in admonitions
- width option of figure directive does not work if align option specified at same time (ref: #2595³²⁰⁸)
- #2590³²⁰⁹: The inputenc package breaks compiling under lualatex and xelatex
- #2540³²¹⁰: date on latex front page use different font
- Suppress "document isn't included in any toctree" warning if the document is included (ref: #2603³²¹¹)
- #2614³²¹²: Some tables in PDF output will end up shifted if user sets non zero parindent in preamble
- #2602³²¹³: URL redirection breaks the hyperlinks generated by *sphinx.ext.intersphinx*
- #2613³²¹⁴: Show warnings if merged extensions are loaded

- #2619³²¹⁵: make sure amstext LaTeX package always loaded (ref: d657225, 488ee52, 9d82cad and #2615³²¹⁶)
- #2593³²¹⁷: latex crashes if any figures in the table

14.123 Release 1.4.2 (released May 29, 2016)

Features added

- Now suppress_warnings accepts following configurations (ref: #2451³²¹⁸, #2466³²¹⁹):
 - app.add_node
 - app.add_directive
 - app.add_role
 - app.add_generic_role
 - app.add_source_parser
 - image.data_uri
 - image.nonlocal_uri
- #2453³²²⁰: LaTeX writer allows page breaks in topic contents; and their horizontal extent now fits in the line width (with shadow in margin). Also warning-type admonitions allow page breaks and their vertical spacing has been made more coherent with the one for hint-type notices (ref #2446³²²¹).
- #2459³²²²: the framing of literal code-blocks in LaTeX output (and not only the code lines themselves) obey the indentation in lists or quoted blocks.
- #2343³²²³: the long source lines in code-blocks are wrapped (without modifying the line numbering) in LaTeX output (ref #1534³²²⁴, #2304³²²⁵).

- #2370³²²⁶: the equations are slightly misaligned in LaTeX writer
- #1817³²²⁷, #2077³²²⁸: suppress pep8 warnings on conf.py generated by sphinx-quickstart
- #2407³²²⁹: building docs crash if document includes large data image URIs
- #2436³²³⁰: Sphinx does not check version by needs_sphinx if loading extensions failed

- #2397³²³¹: Setup shorthandoff for Turkish documents
- #2447³²³²: VerbatimBorderColor wrongly used also for captions of PDF
- #2456³²³³: C++, fix crash related to document merging (e.g., singlehtml and Latex builders).
- #2446³²³⁴: latex(pdf) sets local tables of contents (or more generally topic nodes) in unbreakable boxes, causes overflow at bottom
- #2476³²³⁵: Omit MathJax markers if :nowrap: is given
- #2465³²³⁶: latex builder fails in case no caption option is provided to toctree directive
- · Sphinx crashes if self referenced toctree found
- #2481³²³⁷: spelling mistake for mecab search splitter. Thanks to Naoki Sato.
- #2309³²³⁸: Fix could not refer "indirect hyperlink targets" by ref-role
- intersphinx fails if mapping URL contains any port
- #2088³²³⁹: intersphinx crashes if the mapping URL requires basic auth
- #2304³²⁴⁰: auto line breaks in latexpdf codeblocks
- #1534³²⁴¹: Word wrap long lines in Latex verbatim blocks
- #2460³²⁴²: too much white space on top of captioned literal blocks in PDF output
- Show error reason when multiple math extensions are loaded (ref: #2499³²⁴³)
- #2483³²⁴⁴: any figure number was not assigned if figure title contains only non text objects
- #2501³²⁴⁵: Unicode subscript numbers are normalized in LaTeX
- #2492³²⁴⁶: Figure directive with :figwidth: generates incorrect Latex-code
- The caption of figure is always put on center even if :align: was specified
- #2526³²⁴⁷: LaTeX writer crashes if the section having only images
- #2522³²⁴⁸: Sphinx touches mo files under installed directory that caused permission error.
- #2536³²⁴⁹: C++, fix crash when an immediately nested scope has the same name as the current scope.
- #2555³²⁵⁰: Fix crash on any-references with unicode.
- #2517³²⁵¹: wrong bookmark encoding in PDF if using LuaLaTeX

- #2521³²⁵²: generated Makefile causes BSD make crashed if sphinx-build not found
- #2470³²⁵³: typing backport package causes autodoc errors with python 2.7
- sphinx.ext.intersphinx crashes if non-string value is used for key of intersphinx_mapping
- #2518³²⁵⁴: intersphinx_mapping disallows non alphanumeric keys
- #2558³²⁵⁵: unpack error on devhelp builder
- #2561³²⁵⁶: Info builder crashes when a footnote contains a link
- #2565³²⁵⁷: The descriptions of objects generated by sphinx.ext.autosummary overflow lines at LaTeX writer
- Extend pdflatex config in sphinx.sty to subparagraphs (ref: #2551³²⁵⁸)
- #2445³²⁵⁹: rst_prolog and rst_epilog affect to non reST sources
- #2576³²⁶⁰: sphinx.ext.imgmath crashes if subprocess raises error
- #2577³²⁶¹: sphinx.ext.imgmath: Invalid argument are passed to dvisvgm
- #2556³²⁶²: Xapian search does not work with Python 3
- #2581³²⁶³: The search doesn't work if language="es" (Spanish)
- #2382³²⁶⁴: Adjust spacing after abbreviations on figure numbers in LaTeX writer
- #2383³²⁶⁵: The generated footnote by latex_show_urls overflows lines
- #2497³²⁶⁶, #2552³²⁶⁷: The label of search button does not fit for the button itself

14.124 Release 1.4.1 (released Apr 12, 2016)

Incompatible changes

• The default format of today_fmt and html_last_updated_fmt is back to strftime format again. Locale Date Markup Language is also supported for backward compatibility until Sphinx 1.5.

Translations

- Added Welsh translation, thanks to Geraint Palmer.
- · Added Greek translation, thanks to Stelios Vitalis.
- Added Esperanto translation, thanks to Dinu Gherman.
- · Added Hindi translation, thanks to Purnank H. Ghumalia.
- Added Romanian translation, thanks to Razvan Stefanescu.

Bugs fixed

- C++, added support for extern and thread_local.
- C++, type declarations are now using the prefixes typedef, using, and type, depending on the style of declaration.
- #2413³²⁶⁸: C++, fix crash on duplicate declarations
- #2394³²⁶⁹: Sphinx crashes when html_last_updated_fmt is invalid
- #2408³²⁷⁰: dummy builder not available in Makefile and make.bat
- #2412³²⁷¹: hyperlink targets are broken in LaTeX builder
- figure directive crashes if non paragraph item is given as caption
- #2418³²⁷²: time formats no longer allowed in today fmt
- #2395³²⁷³: Sphinx crashes if unicode character in image filename
- #2396³²⁷⁴: "too many values to unpack" in genindex-single
- #2405³²⁷⁵: numref link in PDF jumps to the wrong location
- #2414³²⁷⁶: missing number in PDF hyperlinks to code listings
- #2440³²⁷⁷: wrong import for gmtime. Thanks to Uwe L. Korn.

14.125 Release 1.4 (released Mar 28, 2016)

Incompatible changes

• Drop PorterStemmer package support. Use PyStemmer instead of PorterStemmer to accelerate stemming.

³²⁷⁷ https://github.com/sphinx-doc/sphinx/issues/2440

- sphinx_rtd_theme has become optional. Please install it manually, Refs #2087³²⁷⁸, #2086³²⁷⁹, #1845³²⁸⁰ and #2097³²⁸¹. Thanks to Victor Zverovich.
- #22313282: Use DUrole instead of DUspan for custom roles in LaTeX writer. It enables to take title of roles as an argument of custom macros.
- #2022³²⁸³: 'Thumbs.db' and '.DS Store' are added to exclude_patterns default values in conf.py that will be provided on sphinx-quickstart.
- #2027³²⁸⁴, #2208³²⁸⁵: The html_title accepts string values only. And the None value cannot be accepted.
- sphinx.ext.graphviz: show graph image in inline by default
- #2060³²⁸⁶, #2224³²⁸⁷: The manpage role now generate sphinx.addnodes.manpage node instead of sphinx. addnodes.literal_emphasis node.
- #2022³²⁸⁸: html_extra_path also copies dotfiles in the extra directory, and refers to exclude_patterns to exclude extra files and directories.
- #2300³²⁸⁹: enhance autoclass:: to use the docstring of __new__ if __init__ method's is missing of empty
- #2251³²⁹⁰: Previously, under glossary directives, multiple terms for one definition are converted into single term node and the each terms in the term node are separated by termsep node. In new implementation, each terms are converted into individual term nodes and termsep node is removed. By this change, output layout of every builders are changed a bit.
- The default highlight language is now Python 3. This means that source code is highlighted as Python 3 (which is mostly a superset of Python 2), and no parsing is attempted to distinguish valid code. To get the old behavior back, add highlight_language = "python" to conf.py.
- Locale Date Markup Language³²⁹¹ like "MMMM dd, YYYY" is default format for today_fmt and html_last_updated_fmt. However strftime format like "%B %d, %Y" is also supported for backward compatibility until Sphinx 1.5. Later format will be disabled from Sphinx 1.5.
- #2327³²⁹²: latex_use_parts is deprecated now. Use latex_toplevel_sectioning instead.
- #2337³²⁹³: Use \url{URL} macro instead of \href{URL}{URL} in LaTeX writer.
- #1498³²⁹⁴: manpage writer: don't make whole of item in definition list bold if it includes strong node.
- #582³²⁹⁵: Remove hint message from quick search box for html output.
- #2378³²⁹⁶: Sphinx now bundles newfloat.sty

Features added

- #2092³²⁹⁷: add todo directive support in napoleon package.
- #1962³²⁹⁸: when adding directives, roles or nodes from an extension, warn if such an element is already present (built-in or added by another extension).
- #1909³²⁹⁹: Add "doc" references to Intersphinx inventories.
- C++ type alias support (e.g., .. type:: T = int).
- C++ template support for classes, functions, type aliases, and variables (#1729³³⁰⁰, #1314³³⁰¹).
- C++, added new scope management directives namespace-push and namespace-pop.
- #1970³³⁰²: Keyboard shortcuts to navigate Next and Previous topics
- Intersphinx: Added support for fetching Intersphinx inventories with URLs using HTTP basic auth.
- C++, added support for template parameter in function info field lists.
- C++, added support for pointers to member (function).
- #2113³³⁰³: Allow :class: option to code-block directive.
- #2192³³⁰⁴: Imgmath (pngmath with svg support).
- #2200³³⁰⁵: Support XeTeX and LuaTeX for the LaTeX builder.
- #1906³³⁰⁶: Use xcolor over color for fcolorbox where available for LaTeX output.
- #2216³³⁰⁷: Texinputs makefile improvements.
- #2170³³⁰⁸: Support for Chinese language search index.
- #2214³³⁰⁹: Add sphinx.ext.githubpages to publish the docs on GitHub Pages
- #1030³³¹⁰: Make page reference names for latex_show_pagerefs translatable
- #2162³³¹¹: Add Sphinx.add source parser() to add source suffix and source parsers from extension
- #2207³³¹²: Add sphinx.parsers.Parser class; a base class for new parsers
- #656³³¹³: Add graphviz_dot option to graphviz directives to switch the dot command
- #1939³³¹⁴: Added the dummy builder: syntax check without output.
- #2230³³¹⁵: Add math_number_all option to number all displayed math in math extensions

- #2235³³¹⁶: needs_sphinx supports micro version comparison
- #2282³³¹⁷: Add "language" attribute to html tag in the "basic" theme
- #1779³³¹⁸: Add EPUB 3 builder
- #1751³³¹⁹: Add todo_link_only to avoid file path and line indication on todolist. Thanks to Francesco Montesano.
- #2199³³²⁰: Use imagesize package to obtain size of images.
- #1099³³²¹: Add configurable retries to the linkcheck builder. Thanks to Alex Gaynor. Also don't check anchors starting with!.
- #2300³³²²: enhance autoclass:: to use the docstring of __new__ if __init__ method's is missing of empty
- #1858³³²³: Add Sphinx.add enumerable node() to add enumerable nodes for numfig feature
- #1286³³²⁴, #2099³³²⁵: Add sphinx.ext.autosectionlabel extension to allow reference sections using its title. Thanks to Tadhg O'Higgins.
- #1854³³²⁶: Allow to choose Janome for Japanese splitter.
- #1853³³²⁷: support custom text splitter on html search with language='ja'.
- #2320³³²⁸: classifier of glossary terms can be used for index entries grouping key The classifier also be used for translation. See also *Glossary*.
- #2308³³²⁹: Define \tablecontinued macro to redefine the style of continued label for longtables.
- Select an image by similarity if multiple images are globbed by .. image:: filename.*
- #1921³³³⁰: Support figure substitutions by language and figure_language_filename
- #2245³³³¹: Add latex_elements["passoptionstopackages"] option to call PassOptionsToPackages in early stage of preambles.
- #2340³³³²: Math extension: support alignment of multiple equations for MathJax.
- #2338³³³³: Define \titleref macro to redefine the style of title-reference roles.
- Define \menuselection and \accelerator macros to redefine the style of menuselection roles.
- Define \crossref macro to redefine the style of references
- #2301³³³⁴: Texts in the classic html theme should be hyphenated.
- #2355³³³⁵: Define \termref macro to redefine the style of term roles.

³³³⁵ https://github.com/sphinx-doc/sphinx/issues/2355

- Add *suppress_warnings* to suppress arbitrary warning message (experimental)
- #2229³³³⁶: Fix no warning is given for unknown options
- #2327³³³⁷: Add latex_toplevel_sectioning to switch the top level sectioning of LaTeX document.

- #1913³³³⁸: C++, fix assert bug for enumerators in next-to-global and global scope.
- C++, fix parsing of 'signed char' and 'unsigned char' as types.
- C++, add missing support for 'friend' functions.
- C++, add missing support for virtual base classes (thanks to Rapptz).
- C++, add support for final classes.
- C++, fix parsing of types prefixed with 'enum'.
- #2023³³³⁹: Dutch search support uses Danish stemming info.
- C++, add support for user-defined literals.
- #1804³³⁴⁰: Now html output wraps overflowed long-line-text in the sidebar. Thanks to Hassen ben tanfous.
- #2183³³⁴¹: Fix porterstemmer causes make json to fail.
- #1899³³⁴²: Ensure list is sent to OptParse.
- #2164³³⁴³: Fix wrong check for pdftex inside sphinx.sty (for graphicx package option).
- #2165³³⁴⁴, #2218³³⁴⁵: Remove faulty and non-need conditional from sphinx.sty.
- Fix broken LaTeX code is generated if unknown language is given
- #1944³³⁴⁶: Fix rst_prolog breaks file-wide metadata
- #2074³³⁴⁷: make gettext should use canonical relative paths for .pot. Thanks to anatoly techtonik.
- #2311³³⁴⁸: Fix sphinx.ext.inheritance diagram raises AttributeError
- #2251³³⁴⁹: Line breaks in .rst files are transferred to .pot files in a wrong way.
- #794³³⁵⁰: Fix date formatting in latex output is not localized
- Remove image/gif from supported_image_types of LaTeX writer (#2272³³⁵¹)
- Fix ValueError is raised if LANGUAGE is empty string
- Fix unpack warning is shown when the directives generated from Sphinx.add_crossref_type is used

https://github.com/sphinx-doc/sphinx/issues/2272

- The default highlight language is now default. This means that source code is highlighted as Python 3 (which is mostly a superset of Python 2) if possible. To get the old behavior back, add highlight_language = "python" to conf.py.
- #2329³³⁵²: Refresh environment forcedly if source directory has changed.
- #23313353; Fix code-blocks are filled by block in dvi; remove xcdraw option from xcolor package
- Fix the confval type checker emits warnings if unicode is given to confvals which expects string value
- #2360³³⁵⁴: Fix numref in LaTeX output is broken
- #2361³³⁵⁵: Fix additional paragraphs inside the "compound" directive are indented
- #2364³³⁵⁶: Fix KeyError 'rootSymbol' on Sphinx upgrade from older version.
- #2348³³⁵⁷: Move amsmath and amssymb to before fontpkg on LaTeX writer.
- #2368³³⁵⁸: Ignore emacs lock files like .#foo.rst by default.
- #2262³³⁵⁹: literal_block and its caption has been separated by pagebreak in LaTeX output.
- #2319³³⁶⁰: Fix table counter is overridden by code-block's in LaTeX. Thanks to ifbu.
- Fix unpack warning if combined with 3rd party domain extensions.
- #1153³³⁶¹: Fix figures in sidebar causes latex build error.
- #2358³³⁶²: Fix user-preamble could not override the tocdepth definition.
- #2358³³⁶³: Reduce tocdepth if part or chapter is used for top sectionlevel
- #2351³³⁶⁴: Fix footnote spacing
- #2363³³⁶⁵: Fix toctree() in templates generates broken links in SingleHTMLBuilder.
- #2366³³⁶⁶: Fix empty hyperref is generated on toctree in HTML builder.

Documentation

• #1757³³⁶⁷: Fix for usage of html_last_updated_fmt. Thanks to Ralf Hemmecke.

14.126 Release 1.3.6 (released Feb 29, 2016)

Features added

• #1873³³⁶⁸, #1876³³⁶⁹, #2278³³⁷⁰: Add page_source_suffix html context variable. This should be introduced with *source_parsers* feature. Thanks for Eric Holscher.

Bugs fixed

- #2265³³⁷¹: Fix babel is used in spite of disabling it on latex_elements
- #2295³³⁷²: Avoid mutating dictionary errors while enumerating members in autodoc with Python 3
- #2291³³⁷³: Fix pdflatex "Counter too large" error from footnotes inside tables of contents
- #2292³³⁷⁴: Fix some footnotes disappear from LaTeX output
- #2287³³⁷⁵: sphinx.transforms.Locale always uses rst parser. Sphinx i18n feature should support parsers that specified source_parsers.
- #2290³³⁷⁶: Fix sphinx.ext.mathbase use of amsfonts may break user choice of math fonts
- #2324³³⁷⁷: Print a hint how to increase the recursion limit when it is hit.
- #1565³³⁷⁸, #2229³³⁷⁹: Revert new warning; the new warning will be triggered from version 1.4 on.
- #2329³³⁸⁰: Refresh environment forcedly if source directory has changed.
- #2019³³⁸¹: Fix the domain objects in search result are not escaped

14.127 Release 1.3.5 (released Jan 24, 2016)

- Fix line numbers was not shown on warnings in LaTeX and texinfo builders
- Fix filenames were not shown on warnings of citations
- Fix line numbers was not shown on warnings in LaTeX and texinfo builders
- Fix line numbers was not shown on warnings of indices
- #2026³³⁸²: Fix LaTeX builder raises error if parsed-literal includes links

- #2243³³⁸³: Ignore strange docstring types for classes, do not crash
- #2247³³⁸⁴: Fix #2205³³⁸⁵ breaks make html for definition list with classifiers that contains regular-expression like string
- #1565³³⁸⁶: Sphinx will now emit a warning that highlighting was skipped if the syntax is incorrect for code-block, literalinclude and so on.
- #2211³³⁸⁷: Fix paragraphs in table cell doesn't work in Latex output
- #2253³³⁸⁸: :pyobject: option of literalinclude directive can't detect indented body block when the block starts with blank or comment lines.
- Fix TOC is not shown when no :maxdepth: for toctrees (ref: #771³³⁸⁹)
- Fix warning message for :numref: if target is in orphaned doc (ref: #2244³³⁹⁰)

14.128 Release 1.3.4 (released Jan 12, 2016)

- #2134³³⁹¹: Fix figure caption with reference causes latex build error
- #2094³³⁹²: Fix rubric with reference not working in Latex
- #2147³³⁹³: Fix literalinclude code in latex does not break in pages
- #1833³³⁹⁴: Fix email addresses is showed again if latex_show urls is not None
- #2176³³⁹⁵: sphinx.ext.graphviz: use <object> instead of to embed svg
- #967³³⁹⁶: Fix SVG inheritance diagram is not hyperlinked (clickable)
- #1237³³⁹⁷: Fix footnotes not working in definition list in LaTeX
- #2168³³⁹⁸: Fix raw directive does not work for text writer
- #2171³³⁹⁹: Fix cannot linkcheck url with unicode
- #2182³⁴⁰⁰: LaTeX: support image file names with more than 1 dots
- #2189³⁴⁰¹: Fix previous sibling link for first file in subdirectory uses last file, not intended previous from root toctree

- #2003³⁴⁰²: Fix decode error under python2 (only) when make linkcheck is run
- #2186³⁴⁰³: Fix LaTeX output of mathbb in math
- #1480³⁴⁰⁴, #2188³⁴⁰⁵: LaTeX: Support math in section titles
- #2071³⁴⁰⁶: Fix same footnote in more than two section titles => LaTeX/PDF Bug
- #2040³⁴⁰⁷: Fix UnicodeDecodeError in sphinx-apidoc when author contains non-ascii characters
- #2193³⁴⁰⁸: Fix shutil.SameFileError if source directory and destination directory are same
- #2178³⁴⁰⁹: Fix unparsable C++ cross-reference when referencing a function with :cpp:any:
- #2206³⁴¹⁰: Fix Sphinx latex doc build failed due to a footnotes
- #2201³⁴¹¹: Fix wrong table caption for tables with over 30 rows
- #2213³⁴¹²: Set <blockguote> in the classic theme to fit with
- #1815³⁴¹³: Fix linkcheck does not raise an exception if warniserror set to true and link is broken
- #2197³⁴¹⁴: Fix slightly cryptic error message for missing index.rst file
- #1894³⁴¹⁵: Unlisted phony targets in quickstart Makefile
- #2125³⁴¹⁶: Fix unifies behavior of collapsed fields (GroupedField and TypedField)
- #1408³⁴¹⁷: Check latex logo validity before copying
- #771³⁴¹⁸: Fix latex output doesn't set tocdepth
- #1820³⁴¹⁹: On Windows, console coloring is broken with colorama version 0.3.3. Now Sphinx use colorama>=0.3.5 to avoid this problem.
- #2072³⁴²⁰: Fix footnotes in chapter-titles do not appear in PDF output
- #1580³⁴²¹: Fix paragraphs in longtable don't work in Latex output
- #1366³⁴²²: Fix centered image not centered in latex
- #1860³⁴²³: Fix man page using :samp: with braces font doesn't reset
- #1610³⁴²⁴: Sphinx crashes in Japanese indexing in some systems
- Fix Sphinx crashes if mecab initialization failed

³⁴²³ https://github.com/sphinx-doc/sphinx/issues/1860

³⁴²⁴ https://github.com/sphinx-doc/sphinx/issues/1610

- #2160³⁴²⁵: Fix broken TOC of PDFs if section includes an image
- #2172³⁴²⁶: Fix dysfunctional admonition \py@lightbox in sphinx.sty. Thanks to jfbu.
- #2198³⁴²⁷, *#2205 > : make gettext generate broken magid for definition lists.
- #2062³⁴²⁸: Escape characters in doctests are treated incorrectly with Python 2.
- #2225³⁴²⁹: Fix if the option does not begin with dash, linking is not performed
- #2226³⁴³⁰: Fix math is not HTML-encoded when :nowrap: is given (jsmath, mathjax)
- #1601³⁴³¹, #2220³⁴³²: 'any' role breaks extended domains behavior. Affected extensions doesn't support resolve_any_xref and resolve_xref returns problematic node instead of None. sphinxcontrib-httpdomain is one of them.
- #2229³⁴³³: Fix no warning is given for unknown options

14.129 Release 1.3.3 (released Dec 2, 2015)

Bugs fixed

- #2177³⁴³⁴: Fix parallel hangs
- #2012³⁴³⁵: Fix exception occurred if numfig_format is invalid
- #2142³⁴³⁶: Provide non-minified JS code in sphinx/search/non-minified-js/*.js for source distribution on PyPI.
- #2148³⁴³⁷: Error while building devhelp target with non-ASCII document.

14.130 Release 1.3.2 (released Nov 29, 2015)

Features added

• #1935³⁴³⁸: Make "numfig format" overridable in latex elements.

³⁴³⁷ https://github.com/sphinx-doc/sphinx/issues/2148

³⁴³⁸ https://github.com/sphinx-doc/sphinx/issues/1935

- #1976³⁴³⁹: Avoid "2.0" version of Babel because it doesn't work with Windows environment.
- Add a "default.css" stylesheet (which imports "classic.css") for compatibility
- #1788³⁴⁴⁰: graphviz extension raises exception when caption option is present.
- #1789³⁴⁴¹: :pyobject: option of literalinclude directive includes following lines after class definitions
- #1790³⁴⁴²: literalinclude strips empty lines at the head and tail
- #1802³⁴⁴³: load plugin themes automatically when theme.conf use it as 'inherit'. Thanks to Takayuki Hirai.
- #1794³⁴⁴⁴: custom theme extended from alabaster or sphinx_rtd_theme can't find base theme.
- #1834³⁴⁴⁵: compatibility for Docutils 0.13: handle_io_errors keyword argument for docutils.io.FileInput cause TypeError.
- #1823³⁴⁴⁶: '.' as <module_path> for sphinx-apidoc cause an unfriendly error. Now '.' is converted to absolute path automatically.
- Fix a crash when setting up extensions which do not support metadata.
- #1784³⁴⁴⁷: Provide non-minified JS code in sphinx/search/non-minified-js/*.js
- #1822³⁴⁴⁸, #1892³⁴⁴⁹: Fix regression for #1061³⁴⁵⁰. autosummary can't generate doc for imported members since Sphinx 1.3b3. Thanks to Eric Larson.
- #1793³⁴⁵¹, #1819³⁴⁵²: "see also" misses a linebreak in text output. Thanks to Takayuki Hirai.
- #1780³⁴⁵³, #1866³⁴⁵⁴: "make text" shows "class" keyword twice. Thanks to Takayuki Hirai.
- #1871³⁴⁵⁵: Fix for LaTeX output of tables with one column and multirows.
- Work around the lack of the HTMLParserError exception in Python 3.5.
- #1949³⁴⁵⁶: Use safe_getattr in the coverage builder to avoid aborting with descriptors that have custom behavior.
- #1915³⁴⁵⁷: Do not generate smart quotes in doc field type annotations.
- #1796³⁴⁵⁸: On py3, automated .mo building caused UnicodeDecodeError.
- #1923³⁴⁵⁹: Use babel features only if the babel latex element is nonempty.

³⁴⁵⁹ https://github.com/sphinx-doc/sphinx/issues/1923

- #1942³⁴⁶⁰: Fix a KeyError in websupport.
- #1903³⁴⁶¹: Fix strange id generation for glossary terms.
- make text will crush if a definition list item has more than 1 classifiers as: term : classifier1 : classifier2.
- #1855³⁴⁶²: make gettext generates broken po file for definition lists with classifier.
- #1869³⁴⁶³: Fix problems when dealing with files containing non-ASCII characters. Thanks to Marvin Schmidt.
- #1798³⁴⁶⁴: Fix building LaTeX with references in titles.
- #1725³⁴⁶⁵: On py2 environment, doctest with using non-ASCII characters causes 'ascii' codec can't decode byte exception.
- #1540³⁴⁶⁶: Fix RuntimeError with circular referenced toctree
- #1983³⁴⁶⁷: i18n translation feature breaks references which uses section name.
- #1990³⁴⁶⁸: Use caption of toctree to title of tableofcontents in LaTeX
- #1987³⁴⁶⁹: Fix ampersand is ignored in :menuselection: and :guilabel: on LaTeX builder
- #1994³⁴⁷⁰: More supporting non-standard parser (like recommonmark parser) for Translation and WebSupport feature. Now node.rawsource is fall backed to node.astext() during Docutils transforming.
- #1989³⁴⁷¹: "make blahblah" on Windows indicate help messages for sphinx-build every time. It was caused by wrong make.bat that generated by Sphinx 1.3.0/1.3.1.
- On Py2 environment, conf.py that is generated by sphinx-quickstart should have u prefixed config value for 'version' and 'release'.
- #2102³⁴⁷²: On Windows + Py3, using | today | and non-ASCII date format will raise UnicodeEncodeError.
- #1974³⁴⁷³: UnboundLocalError: local variable 'domain' referenced before assignment when using *any* role and *sphinx.ext.intersphinx* in same time.
- #2121³⁴⁷⁴: multiple words search doesn't find pages when words across on the page title and the page content.
- #1884³⁴⁷⁵, #1885³⁴⁷⁶: plug-in html themes cannot inherit another plug-in theme. Thanks to Suzumizaki.
- #1818³⁴⁷⁷: *sphinx.ext.todo* directive generates broken html class attribute as 'admonition-' when *language* is specified with non-ASCII linguistic area like 'ru' or 'ja'. To fix this, now todo directive can use :class: option.
- #2140³⁴⁷⁸: Fix footnotes in table has broken in LaTeX

```

3478 https://github.com/sphinx-doc/sphinx/issues/2140

• #2127³⁴⁷⁹: MecabBinder for html searching feature doesn't work with Python 3. Thanks to Tomoko Uchida.

14.131 Release 1.3.1 (released Mar 17, 2015)

Bugs fixed

- #1769³⁴⁸⁰: allows generating quickstart files/dirs for destination dir that doesn't overwrite existent files/dirs. Thanks to WAKAYAMA shirou.
- #1773³⁴⁸¹: sphinx-quickstart doesn't accept non-ASCII character as a option argument.
- #1766³⁴⁸²: the message "least Python 2.6 to run" is at best misleading.
- #1772³⁴⁸³: cross reference in docstrings like :param .write: breaks building.
- #1770³⁴⁸⁴, #1774³⁴⁸⁵: literalinclude with empty file occurs exception. Thanks to Takayuki Hirai.
- #1777³⁴⁸⁶: Sphinx 1.3 can't load extra theme. Thanks to tell-k.
- #1776³⁴⁸⁷: source_suffix = ['.rst'] cause unfriendly error on prior version.
- #1771³⁴⁸⁸: automated .mo building doesn't work properly.
- #1783³⁴⁸⁹: Autodoc: Python2 Allow unicode string in __all__. Thanks to Jens Hedegaard Nielsen.
- #1781³⁴⁹⁰: Setting html_domain_indices to a list raises a type check warnings.

14.132 Release 1.3 (released Mar 10, 2015)

Incompatible changes

- Roles ref, term and menusel now don't generate emphasis 3491 nodes anymore. If you want to keep italic style, adapt your stylesheet.
- Role numref uses %s as special character to indicate position of figure numbers instead # symbol.

```
3479 https://github.com/sphinx-doc/sphinx/issues/2127

³⁴⁹⁰ https://github.com/sphinx-doc/sphinx/issues/1781

³⁴⁹¹ https://docutils.sourceforge.io/docs/ref/rst/roles.html#emphasis

Features added

- Add convenience directives and roles to the C++ domain: directive cpp:var as alias for cpp:member, role :cpp:var as alias for :cpp:member, and role any for cross-reference to any C++ declaraction. #1577³⁴⁹², #1744³⁴⁹³
- The *source_suffix* config value can now be a list of multiple suffixes.
- Add the ability to specify source parsers by source suffix with the source_parsers config value.
- #1675³⁴⁹⁴: A new builder, AppleHelpBuilder, has been added that builds Apple Help Books.

Bugs fixed

- 1.3b3 change breaks a previous gettext output that contains duplicated msgid such as "foo bar" and "version changes in 1.3: foo bar".
- #1745³⁴⁹⁵: latex builder cause maximum recursion depth exceeded when a footnote has a footnote mark itself.
- #1748³⁴⁹⁶: SyntaxError in sphinx/ext/ifconfig.py with Python 2.6.
- #1658³⁴⁹⁷, #1750³⁴⁹⁸: No link created (and warning given) if option does not begin with -, / or +. Thanks to Takayuki Hirai.
- #1753³⁴⁹⁹: C++, added missing support for more complex declarations.
- #1700³⁵⁰⁰: Add :caption: option for *toctree*.
- #1742³⁵⁰¹: :name: option is provided for toctree, code-block and literalinclude directives.
- #1756³⁵⁰²: Incorrect section titles in search that was introduced from 1.3b3.
- #1746³⁵⁰³: C++, fixed name lookup procedure, and added missing lookups in declarations.
- #1765³⁵⁰⁴: C++, fix old id generation to use fully qualified names.

Documentation

• #1651³⁵⁰⁵: Add vartype field description for python domain.

³⁵⁰⁴ https://github.com/sphinx-doc/sphinx/issues/1765

³⁵⁰⁵ https://github.com/sphinx-doc/sphinx/issues/1651

14.133 Release 1.3b3 (released Feb 24, 2015)

Incompatible changes

- Dependency requirement updates: Docutils 0.11, Pygments 2.0
- The gettext_enables config value has been renamed to gettext_additional_targets.
- #1735³⁵⁰⁶: Use https://docs.python.org/ instead of http protocol. It was used for *sphinx.ext.intersphinx* and some documentation.

Features added

- #1346³⁵⁰⁷: Add new default theme;
 - Add 'alabaster' theme.
 - Add 'sphinx_rtd_theme' theme.
 - The 'default' html theme has been renamed to 'classic'. 'default' is still available, however it will emit notice a recommendation that using new 'alabaster' theme.
- Added highlight_options configuration value.
- The language config value is now available in the HTML templates.
- The env-updated event can now return a value, which is interpreted as an iterable of additional docnames that need to be rewritten.
- #772³⁵⁰⁸: Support for scoped and unscoped enums in C++. Enumerators in unscoped enums are injected into the parent scope in addition to the enum scope.
- Add todo_include_todos config option to quickstart conf file, handled as described in documentation.
- HTML breadcrumb items tag has class "nav-item" and "nav-item-N" (like nav-item-0, 1, 2...).
- New option *sphinx-quickstart --use-make-mode* for generating Makefile that use sphinx-build makemode.
- #1235³⁵⁰⁹: i18n: several node can be translated if it is set to *gettext_additional_targets* in conf.py. Supported nodes are:
 - 'literal-block'
 - 'doctest-block'
 - 'raw'
 - 'image'
- #1227³⁵¹⁰: Add html_scaled_image_link config option to conf.py, to control scaled image link.

³⁵⁰⁷ https://github.com/sphinx-doc/sphinx/issues/1346

³⁵⁰⁸ https://github.com/sphinx-doc/sphinx/issues/772

³⁵⁰⁹ https://github.com/sphinx-doc/sphinx/issues/1235

³⁵¹⁰ https://github.com/sphinx-doc/sphinx/issues/1227

Bugs fixed

- LaTeX writer now generates correct markup for cells spanning multiple rows.
- #1674³⁵¹¹: Do not crash if a module's __all__ is not a list of strings.
- #1629³⁵¹²: Use VerbatimBorderColor to add frame to code-block in LaTeX
- On windows, make-mode didn't work on Win32 platform if Sphinx was invoked as python sphinx-build.py.
- #1687³⁵¹³: linkcheck now treats 401 Unauthorized responses as "working".
- #1690³⁵¹⁴: toctrees with glob option now can also contain entries for single documents with explicit title.
- #1591³⁵¹⁵: html search results for C++ elements now has correct interpage links.
- bizstyle theme: nested long title pages make long breadcrumb that breaks page layout.
- bizstyle theme: all breadcrumb items become 'Top' on some mobile browser (iPhone5s safari).
- #1722³⁵¹⁶: restore toctree() template function behavior that was changed at 1.3b1.
- #1732³⁵¹⁷: i18n: localized table caption raises exception.
- #1718³⁵¹⁸: :numref: does not work with capital letters in the label
- #1630³⁵¹⁹: resolve CSS conflicts, div.container css target for literal block wrapper now renamed to div. literal-block-wrapper.
- sphinx.util.pycompat has been restored in its backwards-compatibility; slated for removal in Sphinx 1.4.
- #1719³⁵²⁰: LaTeX writer does not respect numref_format option in captions

14.134 Release 1.3b2 (released Dec 5, 2014)

Incompatible changes

• update bundled ez_setup.py for setuptools-7.0 that requires Python 2.6 or later.

Features added

- #1597³⁵²¹: Added possibility to return a new template name from html-page-context.
- PR#314³⁵²², #1150³⁵²³: Configuration values are now checked for their type. A warning is raised if the configured and the default value do not have the same type and do not share a common non-trivial base class.

³⁵²² https://github.com/sphinx-doc/sphinx/issues/314

³⁵²³ https://github.com/sphinx-doc/sphinx/issues/1150

Bugs fixed

- PR#311³⁵²⁴: sphinx-quickstart does not work on python 3.4.
- Fix autodoc_docstring_signature not working with signatures in class docstrings.
- Rebuilding cause crash unexpectedly when source files were added.
- #1607³⁵²⁵: Fix a crash when building latexpdf with "howto" class
- #1251³⁵²⁶: Fix again. Sections which depth are lower than :tocdepth: should not be shown on localtoc sidebar.
- make-mode didn't work on Win32 platform if Sphinx was installed by wheel package.

14.135 Release 1.3b1 (released Oct 10, 2014)

Incompatible changes

- Dropped support for Python 2.5, 3.1 and 3.2.
- Dropped support for Docutils versions up to 0.9.
- Removed the sphinx.ext.oldcmarkup extension.
- The deprecated config values exclude_trees, exclude_dirnames and unused_docs have been removed.
- A new node, sphinx.addnodes.literal_strong, has been added, for text that should appear literally (i.e. no smart quotes) in strong font. Custom writers will have to be adapted to handle this node.
- PR#269³⁵²⁷, #1476³⁵²⁸: replace <tt> tag by <code>. User customized stylesheets should be updated If the css contain some styles for tt> tag. Thanks to Takeshi Komiya.
- #1543³⁵²⁹: templates_path is automatically added to exclude_patterns to avoid reading autosummary rst templates in the templates directory.
- Custom domains should implement the new *Domain.resolve_any_xref* method to make the *any* role work properly.
- gettext builder: gettext doesn't emit uuid information to generated pot files by default. Please set True to gettext_uuid to emit uuid information. Additionally, if the python-levenshtein 3rd-party package is installed, it will improve the calculation time.
- gettext builder: disable extracting/apply 'index' node by default. Please set 'index' to gettext_enables to enable extracting index entries.
- PR#307³⁵³⁰: Add frame to code-block in LaTeX. Thanks to Takeshi Komiya.

³⁵²⁹ https://github.com/sphinx-doc/sphinx/issues/1543

³⁵³⁰ https://github.com/sphinx-doc/sphinx/issues/307

Features added

- Add support for Python 3.4.
- Add support for Docutils 0.12
- Added sphinx.ext.napoleon extension for NumPy and Google style docstring support.
- Added support for parallel reading (parsing) of source files with the *sphinx-build -j* option. Third-party extensions will need to be checked for compatibility and may need to be adapted if they store information in the build environment object. See *env-merge-info*.
- Added the *any* role that can be used to find a cross-reference of *any* type in *any* domain. Custom domains should implement the new *Domain.resolve_any_xref* method to make this work properly.
- Exception logs now contain the last 10 messages emitted by Sphinx.
- Added support for extension versions (a string returned by setup(), these can be shown in the traceback log files). Version requirements for extensions can be specified in projects using the new *needs_extensions* config value.
- Changing the default role within a document with the default-role³⁵³¹ directive is now supported.
- PR#214³⁵³²: Added stemming support for 14 languages, so that the built-in document search can now handle these. Thanks to Shibukawa Yoshiki.
- PR#296³⁵³³, PR#303³⁵³⁴, #76³⁵³⁵: numfig feature: Assign numbers to figures, tables and code-blocks. This feature is configured with numfig, numfig_secnum_depth and numfig_format. Also numref role is available. Thanks to Takeshi Komiya.
- PR#202³⁵³⁶: Allow "." and "~" prefixed references in :param: doc fields for Python.
- PR#184³⁵³⁷: Add *autodoc_mock_imports*, allowing to mock imports of external modules that need not be present when autodocumenting.
- #925³⁵³⁸: Allow list-typed config values to be provided on the command line, like -D key=val1, val2.
- #668³⁵³⁹: Allow line numbering of *code-block* and *literalinclude* directives to start at an arbitrary line number, with a new lineno-start option.
- PR#172³⁵⁴⁰, PR#266³⁵⁴¹: The *code-block* and *literalinclude* directives now can have a caption option that shows a filename before the code in the output. Thanks to Nasimul Haque, Takeshi Komiya.
- Prompt for the document language in sphinx-quickstart.
- PR#217³⁵⁴²: Added config values to suppress UUID and location information in generated gettext catalogs.
- PR#236³⁵⁴³, #1456³⁵⁴⁴: apidoc: Add a -M option to put module documentation before submodule documentation. Thanks to Wes Turner and Luc Saffre.

- #1434³⁵⁴⁵: Provide non-minified JS files for iguery is and underscore is to clarify the source of the minified files.
- PR#252³⁵⁴⁶, #1291³⁵⁴⁷: Windows color console support. Thanks to meu31.
- PR#255³⁵⁴⁸: When generating latex references, also insert latex target/anchor for the ids defined on the node. Thanks to Olivier Heurtier.
- PR#229³⁵⁴⁹: Allow registration of other translators. Thanks to Russell Sim.
- Add app.set translator() API to register or override a Docutils translator class like html_translator_class.
- PR#267³⁵⁵⁰, #1134³⁵⁵¹: add 'diff' parameter to literalinclude. Thanks to Richard Wall and WAKAYAMA shirou.
- PR#272³⁵⁵²: Added 'bizstyle' theme. Thanks to Shoji KUMAGAI.
- Automatically compile *.mo files from *.po files when *gettext_auto_build* is True (default) and *.po is newer than *.mo file.
- #623³⁵⁵³: sphinx.ext.viewcode supports imported function/class aliases.
- PR#275³⁵⁵⁴: *sphinx.ext.intersphinx* supports multiple target for the inventory. Thanks to Brigitta Sipocz.
- PR#261³⁵⁵⁵: Added the *env-before-read-docs* event that can be connected to modify the order of documents before they are read by the environment.
- #1284³⁵⁵⁶: Program options documented with option can now start with +.
- PR#291³⁵⁵⁷: The caption of *code-block* is recognized as a title of ref target. Thanks to Takeshi Komiya.
- PR#298³⁵⁵⁸: Add new API: add_latex_package(). Thanks to Takeshi Komiya.
- #1344³⁵⁵⁹: add gettext_enables to enable extracting 'index' to gettext catalog output / applying translation catalog to generated documentation.
- PR#301³⁵⁶⁰, #1583³⁵⁶¹: Allow the line numbering of the directive *literalinclude* to match that of the included file, using a new lineno-match option. Thanks to Jeppe Pihl.
- PR#299³⁵⁶²: add various options to sphinx-quickstart. Quiet mode option --quiet will skips wizard mode. Thanks to WAKAYAMA shirou.
- #1623³⁵⁶³: Return types specified with :rtype: are now turned into links if possible.

- #1438³⁵⁶⁴: Updated jQuery version from 1.8.3 to 1.11.1.
- #1568³⁵⁶⁵: Fix a crash when a "centered" directive contains a reference.
- Now sphinx.ext.autodoc works with python-2.5 again.
- #1563³⁵⁶⁶: add_search_language() raises AssertionError for correct type of argument. Thanks to rikoman.
- #1174³⁵⁶⁷: Fix smart quotes being applied inside roles like *program* or *makevar*.
- PR#235³⁵⁶⁸: comment db schema of websupport lacked a length of the node_id field. Thanks to solos.
- #1466³⁵⁶⁹, `PR#241 `_: Fix failure of the cpp domain parser to parse C+11 "variadic templates" declarations. Thanks to Victor Zverovich.
- #1459³⁵⁷⁰, PR#244 : Fix default mathjax js path point to http:// that cause mixed-content error on HTTPS server. Thanks to sbrandtb and robo9k.
- PR#157³⁵⁷¹: autodoc remove spurious signatures from @property decorated attributes. Thanks to David Ham.
- PR#159³⁵⁷²: Add coverage targets to quickstart generated Makefile and make.bat. Thanks to Matthias Troffaes.
- #1251³⁵⁷³: When specifying toctree :numbered: option and :tocdepth: metadata, sub section number that is larger depth than :tocdepth: is shrunk.
- PR#260³⁵⁷⁴: Encode underscore in citation labels for latex export. Thanks to Lennart Fricke.
- PR#264³⁵⁷⁵: Fix could not resolve xref for figure node with :name: option. Thanks to Takeshi Komiya.
- PR#265³⁵⁷⁶: Fix could not capture caption of graphviz node by xref. Thanks to Takeshi Komiya.
- PR#263³⁵⁷⁷, #1013³⁵⁷⁸, #1103³⁵⁷⁹: Rewrite of C++ domain. Thanks to Jakob Lykke Andersen.
 - Hyperlinks to all found nested names and template arguments (#1103³⁵⁸⁰).
 - Support for function types everywhere, e.g., in std::function

 vbool(int, int)> (#1013³⁵⁸¹).
 - Support for virtual functions.
 - Changed interpretation of function arguments to following standard prototype declarations, i.e., void f(arg) means that arg is the type of the argument, instead of it being the name.
 - Updated tests.
 - Updated documentation with elaborate description of what declarations are supported and how the namespace declarations influence declaration and cross-reference lookup.

³⁵⁸¹ https://github.com/sphinx-doc/sphinx/issues/1013

- Index names may be different now. Elements are indexed by their fully qualified name. It should be rather easy to change this behaviour and potentially index by namespaces/classes as well.
- PR#258³⁵⁸², #939³⁵⁸³: Add dedent option for *code-block* and *literalinclude*. Thanks to Zafar Siddiqui.
- PR#268³⁵⁸⁴: Fix numbering section does not work at singlehtml mode. It still ad-hoc fix because there is a issue that section IDs are conflicted. Thanks to Takeshi Komiya.
- PR#273³⁵⁸⁵, #1536³⁵⁸⁶: Fix RuntimeError with numbered circular toctree. Thanks to Takeshi Komiya.
- PR#274³⁵⁸⁷: Set its URL as a default title value if URL appears in toctree. Thanks to Takeshi Komiya.
- PR#276³⁵⁸⁸, #1381³⁵⁸⁹: rfc and pep roles support custom link text. Thanks to Takeshi Komiya.
- PR#277³⁵⁹⁰, #1513³⁵⁹¹: highlights for function pointers in argument list of *c:function*. Thanks to Takeshi Komiya.
- PR#278³⁵⁹²: Fix section entries were shown twice if toctree has been put under only directive. Thanks to Takeshi Komiya.
- #1547³⁵⁹³: pgen2 tokenizer doesn't recognize . . . literal (Ellipsis for py3).
- PR#294³⁵⁹⁴: On LaTeX builder, wrap float environment on writing literal_block to avoid separation of caption and body. Thanks to Takeshi Komiya.
- PR#295³⁵⁹⁵, #1520³⁵⁹⁶: make.bat latexpdf mechanism to cd back to the current directory. Thanks to Peter Suter.
- PR#297³⁵⁹⁷, #1571³⁵⁹⁸: Add imgpath property to all builders. It make easier to develop builder extensions. Thanks to Takeshi Komiya.
- #1584³⁵⁹⁹: Point to master doc in HTML "top" link.
- #1585³⁶⁰⁰: Autosummary of modules broken in Sphinx 1.2.3.
- #1610³⁶⁰¹: Sphinx cause AttributeError when MeCab search option is enabled and python-mecab is not installed.
- #1674³⁶⁰²: Do not crash if a module's __all__ is not a list of strings.
- #1673³⁶⁰³: Fix crashes with *nitpick_ignore* and :doc: references.
- #1686³⁶⁰⁴: ifconfig directive doesn't care about default config values.

• #1642³⁶⁰⁵: Fix only one search result appearing in Chrome.

Documentation

• Add clarification about the syntax of tags. (doc/markup/misc.rst)

14.136 Release 1.2.3 (released Sep 1, 2014)

Features added

- #1518³⁶⁰⁶: sphinx-apidoc command now has a --version option to show version information and exit
- New locales: Hebrew, European Portuguese, Vietnamese.

Bugs fixed

- #636³⁶⁰⁷: Keep straight single quotes in literal blocks in the LaTeX build.
- #1419³⁶⁰⁸: Generated i18n sphinx.js files are missing message catalog entries from '.js_t' and '.html'. The issue was introduced from Sphinx 1.1
- #1363³⁶⁰⁹: Fix i18n: missing python domain's cross-references with currentmodule directive or currentclass directive.
- #1444³⁶¹⁰: autosummary does not create the description from attributes docstring.
- #1457³⁶¹¹: In python3 environment, make linkcheck cause "Can't convert 'bytes' object to str implicitly" error when link target url has a hash part. Thanks to Jorge C.
- #1467³⁶¹²: Exception on Python3 if nonexistent method is specified by automethod
- #1441³⁶¹³: autosummary can't handle nested classes correctly.
- #1499³⁶¹⁴: With non-callable setup in a conf.py, now sphinx-build emits a user-friendly error message.
- #1502³⁶¹⁵: In autodoc, fix display of parameter defaults containing backslashes.
- #1226³⁶¹⁶: autodoc, autosummary: importing setup.py by automodule will invoke setup process and execute sys.exit(). Now Sphinx avoids SystemExit exception and emits warnings without unexpected termination.
- #1503³⁶¹⁷: py:function directive generate incorrectly signature when specifying a default parameter with an empty list []. Thanks to Geert Jansen.
- #1508³⁶¹⁸: Non-ASCII filename raise exception on make singlehtml, latex, man, texinfo and changes.

- #1531³⁶¹⁹: On Python3 environment, docutils.conf with 'source_link=true' in the general section cause type error.
- PR#270³⁶²⁰, #1533³⁶²¹: Non-ASCII docstring cause UnicodeDecodeError when uses with inheritance-diagram directive. Thanks to WAKAYAMA shirou.
- PR#281³⁶²², PR#282³⁶²³, #1509³⁶²⁴: TODO extension not compatible with websupport. Thanks to Takeshi Komiya.
- #1477³⁶²⁵: gettext does not extract nodes.line in a table or list.
- #1544³⁶²⁶: make text generates wrong table when it has empty table cells.
- #1522³⁶²⁷: Footnotes from table get displayed twice in LaTeX. This problem has been appeared from Sphinx 1.2.1 by #949³⁶²⁸.
- #508³⁶²⁹: Sphinx every time exit with zero when is invoked from setup.py command. ex. python setup.py build_sphinx -b doctest return zero even if doctest failed.

14.137 Release 1.2.2 (released Mar 2, 2014)

- PR#211³⁶³⁰: When checking for existence of the *html_logo* file, check the full relative path and not the basename.
- PR#212³⁶³¹: Fix traceback with autodoc and __init__ methods without docstring.
- PR#213³⁶³²: Fix a missing import in the setup command.
- #1357³⁶³³: Option names documented by *option* are now again allowed to not start with a dash or slash, and referencing them will work correctly.
- #1358³⁶³⁴: Fix handling of image paths outside of the source directory when using the "wildcard" style reference.
- #1374³⁶³⁵: Fix for autosummary generating overly-long summaries if first line doesn't end with a period.
- #1383³⁶³⁶: Fix Python 2.5 compatibility of sphinx-apidoc.
- #1391³⁶³⁷: Actually prevent using "pngmath" and "mathjax" extensions at the same time in sphinx-quickstart.
- #1386³⁶³⁸: Fix bug preventing more than one theme being added by the entry point mechanism.

- #1370³⁶³⁹: Ignore "toctree" nodes in text writer, instead of raising.
- #1364³⁶⁴⁰: Fix 'make gettext' fails when the '.. todolist::' directive is present.
- #1367³⁶⁴¹: Fix a change of PR#96³⁶⁴² that break sphinx.util.docfields.Field.make_field interface/behavior for item argument usage.

Documentation

• Extended the documentation about building extensions.

14.138 Release 1.2.1 (released Jan 19, 2014)

- #1335³⁶⁴³: Fix autosummary template overloading with exclamation prefix like {% extends "!autosummary/class.rst" %} cause infinite recursive function call. This was caused by PR#181³⁶⁴⁴.
- #1337³⁶⁴⁵: Fix autodoc with autoclass_content="both" uses useless object.__init__ docstring when class does not have __init__. This was caused by a change for #1138³⁶⁴⁶.
- #1340³⁶⁴⁷: Can't search alphabetical words on the HTML quick search generated with language='ja'.
- #1319³⁶⁴⁸: Do not crash if the html_logo file does not exist.
- #603³⁶⁴⁹: Do not use the HTML-ized title for building the search index (that resulted in "literal" being found on every page with a literal in the title).
- #751³⁶⁵⁰: Allow production lists longer than a page in LaTeX by using longtable.
- #764³⁶⁵¹: Always look for stopwords lowercased in JS search.
- #814³⁶⁵²: autodoc: Guard against strange type objects that don't have __bases__.
- #932³⁶⁵³: autodoc: Do not crash if __doc__ is not a string.
- #933³⁶⁵⁴: Do not crash if an *option* value is malformed (contains spaces but no option name).
- #908³⁶⁵⁵: On Python 3, handle error messages from LaTeX correctly in the pngmath extension.
- #943³⁶⁵⁶: In autosummary, recognize "first sentences" to pull from the docstring if they contain uppercase letters.

```

- #923³⁶⁵⁷: Take the entire LaTeX document into account when caching pngmath-generated images. This rebuilds them correctly when pngmath_latex_preamble changes.
- #901³⁶⁵⁸: Emit a warning when using Docutils' new "math" markup without a Sphinx math extension active.
- #845³⁶⁵⁹: In code blocks, when the selected lexer fails, display line numbers nevertheless if configured.
- #929³⁶⁶⁰: Support parsed-literal blocks in LaTeX output correctly.
- #949³⁶⁶¹: Update the tabulary.sty packed with Sphinx.
- #1050³⁶⁶²: Add anonymous labels into objects.inv to be referenced via *intersphinx*.
- #1095³⁶⁶³: Fix print-media stylesheet being included always in the "scrolls" theme.
- #1085³⁶⁶⁴: Fix current classname not getting set if class description has :noindex: set.
- #1181³⁶⁶⁵: Report option errors in autodoc directives more gracefully.
- #1155³⁶⁶⁶: Fix autodocumenting C-defined methods as attributes in Python 3.
- #1233³⁶⁶⁷: Allow finding both Python classes and exceptions with the "class" and "exc" roles in intersphinx.
- #1198³⁶⁶⁸: Allow "image" for the "figwidth" option of the figure³⁶⁶⁹ directive as documented by docutils.
- #1152³⁶⁷⁰: Fix pycode parsing errors of Python 3 code by including two grammar versions for Python 2 and 3, and loading the appropriate version for the running Python version.
- #1017³⁶⁷¹: Be helpful and tell the user when the argument to *option* does not match the required format.
- #1345³⁶⁷²: Fix two bugs with *nitpick_ignore*; now you don't have to remove the store environment for changes to have effect.
- #1072³⁶⁷³: In the JS search, fix issues searching for upper-cased words by lowercasing words before stemming.
- #1299³⁶⁷⁴: Make behavior of the *math* directive more consistent and avoid producing empty environments in LaTeX output.
- #1308³⁶⁷⁵: Strip HTML tags from the content of "raw" nodes before feeding it to the search indexer.
- #1249³⁶⁷⁶: Fix duplicate LaTeX page numbering for manual documents.
- #1292³⁶⁷⁷: In the linkchecker, retry HEAD requests when denied by HTTP 405. Also make the redirect code apparent and tweak the output a bit to be more obvious.

- #1285³⁶⁷⁸: Avoid name clashes between C domain objects and section titles.
- #848³⁶⁷⁹: Always take the newest code in incremental rebuilds with the *sphinx.ext.viewcode* extension.
- $#979^{3680}$, $#1266^{3681}$: Fix exclude handling in sphinx-apidoc.
- #1302³⁶⁸²: Fix regression in *sphinx.ext.inheritance_diagram* when documenting classes that can't be pickled.
- #1316³⁶⁸³: Remove hard-coded font-face resources from epub theme.
- #1329³⁶⁸⁴: Fix traceback with empty translation msgstr in .po files.
- #1300³⁶⁸⁵: Fix references not working in translated documents in some instances.
- #1283³⁶⁸⁶: Fix a bug in the detection of changed files that would try to access doctrees of deleted documents.
- #1330³⁶⁸⁷: Fix exclude_patterns behavior with subdirectories in the html_static_path.
- #1323³⁶⁸⁸: Fix emitting empty tags in the HTML writer, which is not valid HTML.
- #1147³⁶⁸⁹: Don't emit a sidebar search box in the "singlehtml" builder.

Documentation

• #1325³⁶⁹⁰: Added a "Intersphinx" tutorial section. (doc/tutorial.rst)

14.139 Release 1.2 (released Dec 10, 2013)

Features added

• Added sphinx.version_info tuple for programmatic checking of the Sphinx version.

Incompatible changes

• Removed the sphinx.ext.refcounting extension – it is very specific to CPython and has no place in the main distribution.

```

Bugs fixed

- Restore versionmodified CSS class for versionadded/changed and deprecated directives.
- PR#181³⁶⁹¹: Fix html_theme_path = ['.'] is a trigger of rebuild all documents always (This change keeps the current "theme changes cause a rebuild" feature).
- #1296³⁶⁹²: Fix invalid charset in HTML help generated HTML files for default locale.
- PR#190³⁶⁹³: Fix gettext does not extract figure caption and rubric title inside other blocks. Thanks to Michael Schlenker.
- PR#176³⁶⁹⁴: Make sure setup_command test can always import Sphinx. Thanks to Dmitry Shachnev.
- #1311³⁶⁹⁵: Fix test linkcode.test html fails with C locale and Python 3.
- #1269³⁶⁹⁶: Fix ResourceWarnings with Python 3.2 or later.
- #1138³⁶⁹⁷: Fix: When autodoc_docstring_signature = True and autoclass_content = 'init' or 'both', __init__ line should be removed from class documentation.

14.140 Release 1.2 beta3 (released Oct 3, 2013)

Features added

• The Sphinx error log files will now include a list of the loaded extensions for help in debugging.

Incompatible changes

• PR#154³⁶⁹⁸: Remove "sphinx" prefix from LaTeX class name except 'sphinxmanual' and 'sphinxhowto'. Now you can use your custom document class without 'sphinx' prefix. Thanks to Erik B.

Bugs fixed

- #1265³⁶⁹⁹: Fix i18n: crash when translating a section name that is pointed to from a named target.
- A wrong condition broke the search feature on first page that is usually index.rst. This issue was introduced in 1.2b1.
- #703³⁷⁰⁰: When Sphinx can't decode filenames with non-ASCII characters, Sphinx now catches UnicodeError and will continue if possible instead of raising the exception.

³⁷⁰⁰ https://github.com/sphinx-doc/sphinx/issues/703

14.141 Release 1.2 beta2 (released Sep 17, 2013)

Features added

- apidoc now ignores "_private" modules by default, and has an option -P to include them.
- apidoc now has an option to not generate headings for packages and modules, for the case that the module docstring already includes a reST heading.
- PR#161³⁷⁰¹: apidoc can now write each module to a standalone page instead of combining all modules in a package on one page.
- Builders: rebuild i18n target document when catalog updated.
- Support docutils.conf 'writers' and 'html4css1 writer' section in the HTML writer. The latex, manpage and texinfo writers also support their respective 'writers' sections.
- The new html_extra_path config value allows to specify directories with files that should be copied directly to the HTML output directory.
- Autodoc directives for module data and attributes now support an annotation option, so that the default display
 of the data/attribute value can be overridden.
- PR#136³⁷⁰²: Autodoc directives now support an imported-members option to include members imported from different modules.
- New locales: Macedonian, Sinhala, Indonesian.
- Theme package collection by using setuptools plugin mechanism.

Incompatible changes

• PR#144³⁷⁰³, #1182³⁷⁰⁴: Force timezone offset to LocalTimeZone on POT-Creation-Date that was generated by gettext builder. Thanks to masklinn and Jakub Wilk.

Bugs fixed

- PR#132³⁷⁰⁵: Updated jQuery version to 1.8.3.
- PR#141³⁷⁰⁶, #982³⁷⁰⁷: Avoid crash when writing PNG file using Python 3. Thanks to Marcin Wojdyr.
- PR#145³⁷⁰⁸: In parallel builds, Sphinx drops second document file to write. Thanks to tychoish.
- PR#151³⁷⁰⁹: Some styling updates to tables in LaTeX.
- PR#153³⁷¹⁰: The "extensions" config value can now be overridden.
- PR#155³⁷¹¹: Added support for some C++11 function qualifiers.

- Fix: 'make gettext' caused UnicodeDecodeError when templates contain utf-8 encoded strings.
- #828³⁷¹²: use inspect.getfullargspec() to be able to document functions with keyword-only arguments on Python 3.
- #1090³⁷¹³: Fix i18n: multiple cross references (term, ref, doc) in the same line return the same link.
- #1157³⁷¹⁴: Combination of 'globaltoc.html' and hidden toctree caused exception.
- #1159³⁷¹⁵: fix wrong generation of objects inventory for Python modules, and add a workaround in intersphinx to fix handling of affected inventories.
- #1160³⁷¹⁶: Citation target missing caused an AssertionError.
- #1162³⁷¹⁷, PR#139³⁷¹⁸: singlehtml builder didn't copy images to _images/.
- #1173³⁷¹⁹: Adjust setup.py dependencies because Jinja2 2.7 discontinued compatibility with Python < 3.3 and Python < 2.6. Thanks to Alexander Dupuy.
- #1185³⁷²⁰: Don't crash when a Python module has a wrong or no encoding declared, and non-ASCII characters are included.
- #1188³⁷²¹: sphinx-quickstart raises UnicodeEncodeError if "Project version" includes non-ASCII characters.
- #1189³⁷²²: "Title underline is too short" WARNING is given when using fullwidth characters to "Project name" on quickstart.
- #1190³⁷²³: Output TeX/texinfo/man filename has no basename (only extension) when using non-ASCII characters in the "Project name" on quickstart.
- #1192³⁷²⁴: Fix escaping problem for hyperlinks in the manpage writer.
- #1193³⁷²⁵: Fix i18n: multiple link references in the same line return the same link.
- #1176³⁷²⁶: Fix i18n: footnote reference number missing for auto numbered named footnote and auto symbol footnote.
- PR#146³⁷²⁷, `#1172 https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sphinx/issues/1172https://github.com/sphinx-doc/sph
- #1204³⁷²⁸: Fix wrong generation of links to local intersphinx targets.
- #1206³⁷²⁹: Fix i18n: gettext did not translate admonition directive's title.
- #1232³⁷³⁰: Sphinx generated broken ePub files on Windows.
- #1259³⁷³¹: Guard the debug output call when emitting events; to prevent the repr() implementation of arbitrary

objects causing build failures.

- #1142³⁷³²: Fix NFC/NFD normalizing problem of rst filename on Mac OS X.
- #1234³⁷³³: Ignoring the string consists only of white-space characters.

14.142 Release 1.2 beta1 (released Mar 31, 2013)

Incompatible changes

- Removed sphinx.util.compat.directive_dwim() and sphinx.roles.xfileref_role() which were deprecated since version 1.0.
- PR#122³⁷³⁴: the files given in latex_additional_files now override TeX files included by Sphinx, such as sphinx.sty.
- PR#124³⁷³⁵: the node generated by versionadded, versionchanged and deprecated directives now includes all added markup (such as "New in version X") as child nodes, and no additional text must be generated by writers.
- PR#99³⁷³⁶: the seealso directive now generates admonition nodes instead of the custom seealso node.

Features added

- Markup
 - The toctree directive and the toctree() template function now have an includehidden option that includes hidden toctree entries (bugs $\#790^{3737}$ and $\#1047^{3738}$). A bug in the maxdepth option for the toctree() template function has been fixed (bug $#1046^{3739}$).
 - PR#99³⁷⁴⁰: Strip down seealso directives to normal admonitions. This removes their unusual CSS classes (admonition-see-also), inconsistent LaTeX admonition title ("See Also" instead of "See also"), and spurious indentation in the text builder.
- HTML builder
 - #783³⁷⁴¹: Create a link to full size image if it is scaled with width or height.
 - #1067³⁷⁴²: Improve the ordering of the JavaScript search results; matches in titles come before matches in full text, and object results are better categorized. Also implement a pluggable search scorer.
 - #1053³⁷⁴³: The "rightsidebar" and "collapsiblesidebar" HTML theme options now work together.
 - Update to jQuery 1.7.1 and Underscore.js 1.3.1.
- · Texinfo builder
 - An "Index" node is no longer added when there are no entries.

```
3732 https://github.com/sphinx-doc/sphinx/issues/1142

³⁷⁴¹ https://github.com/sphinx-doc/sphinx/issues/783

³⁷⁴² https://github.com/sphinx-doc/sphinx/issues/1067

³⁷⁴³ https://github.com/sphinx-doc/sphinx/issues/1053

- "deffn" categories are no longer capitalized if they contain capital letters.
- desc_annotation nodes are now rendered.
- strong and emphasis nodes are now formatted like literals. The reason for this is because the standard
 Texinfo markup (*strong* and _emphasis_) resulted in confusing output due to the common usage of using these constructs for documenting parameter names.
- Field lists formatting has been tweaked to better display "Info field lists".
- system_message and problematic nodes are now formatted in a similar fashion as done by the text builder.
- "en-dash" and "em-dash" conversion of hyphens is no longer performed in option directive signatures.
- Qref is now used instead of Qpxref for cross-references which prevents the word "see" from being added before the link (does not affect the Info output).
- The @finalout command has been added for better TeX output.
- transition nodes are now formatted using underscores ("_") instead of asterisks ("*").
- The default value for the paragraphindent has been changed from 2 to 0 meaning that paragraphs are no longer indented by default.
- #1110³⁷⁴⁴: A new configuration value texinfo_no_detailmenu has been added for controlling whether a @detailmenu is added in the "Top" node's menu.
- Detailed menus are no longer created except for the "Top" node.
- Fixed an issue where duplicate domain indices would result in invalid output.

· LaTeX builder:

- PR#115³⁷⁴⁵: Add 'transition' item in latex_elements for customizing how transitions are displayed.
 Thanks to Jeff Klukas.
- PR#114³⁷⁴⁶: The LaTeX writer now includes the "cmap" package by default. The 'cmappkg' item in latex_elements can be used to control this. Thanks to Dmitry Shachnev.
- The 'fontpkg' item in latex_elements now defaults to '' when the language uses the Cyrillic script.
 Suggested by Dmitry Shachnev.
- The <code>latex_documents</code>, <code>texinfo_documents</code>, and <code>man_pages</code> configuration values will be set to default values based on the <code>master_doc</code> if not explicitly set in <code>conf.py</code>. Previously, if these values were not set, no output would be generated by their respective builders.

• Internationalization:

- Add i18n capabilities for custom templates. For example: The Sphinx reference documentation in doc directory provides a sphinx.pot file with message strings from doc/_templates/*.html when using make gettext.
- PR#61³⁷⁴⁷, #703 https://github.com/sphinx-doc/sphinx/issues/703: Add support for non-ASCII file-name handling.

• Other builders:

- Added the Docutils-native XML and pseudo-XML builders. See XMLBuilder and PseudoXMLBuilder.
- PR#45³⁷⁴⁸: The linkcheck builder now checks #anchors for existence.

³⁷⁴⁴ https://github.com/sphinx-doc/sphinx/issues/1110

³⁷⁴⁵ https://github.com/sphinx-doc/sphinx/issues/115

³⁷⁴⁶ https://github.com/sphinx-doc/sphinx/issues/114

³⁷⁴⁷ https://github.com/sphinx-doc/sphinx/issues/61

³⁷⁴⁸ https://github.com/sphinx-doc/sphinx/issues/45

- PR#123³⁷⁴⁹, #1106³⁷⁵⁰: Add epub_use_index configuration value. If provided, it will be used instead of html_use_index for epub builder.
- PR#126³⁷⁵¹: Add epub_tocscope configuration value. The setting controls the generation of the epub toc. The user can now also include hidden toc entries.
- PR#112³⁷⁵²: Add *epub_show_ur1s* configuration value.

• Extensions:

- PR#52³⁷⁵³: special_members flag to autodoc now behaves like members.
- PR#47³⁷⁵⁴: Added *sphinx.ext.linkcode* extension.
- PR#25³⁷⁵⁵: In inheritance diagrams, the first line of the class docstring is now the tooltip for the class.

• Command-line interfaces:

- PR#75³⁷⁵⁶: Added --follow-links option to sphinx-apidoc.
- #869³⁷⁵⁷: sphinx-build now has the option -T for printing the full traceback after an unhandled exception.
- sphinx-build now supports the standard --help and --version options.
- sphinx-build now provides more specific error messages when called with invalid options or arguments.
- sphinx-build now has a verbose option -v which can be repeated for greater effect. A single occurrence
 provides a slightly more verbose output than normal. Two or more occurrences of this option provides more
 detailed output which may be useful for debugging.

· Locales:

- PR#74³⁷⁵⁸: Fix some Russian translation.
- PR#54³⁷⁵⁹: Added Norwegian bokmaal translation.
- PR#35³⁷⁶⁰: Added Slovak translation.
- PR#28³⁷⁶¹: Added Hungarian translation.
- #1113³⁷⁶²: Add Hebrew locale.
- #1097³⁷⁶³: Add Basque locale.
- #1037³⁷⁶⁴: Fix typos in Polish translation. Thanks to Jakub Wilk.
- #1012³⁷⁶⁵: Update Estonian translation.

- Speed up building the search index by caching the results of the word stemming routines. Saves about 20 seconds when building the Python documentation.
- PR#108³⁷⁶⁶: Add experimental support for parallel building with a new *sphinx-build -j* option.

Documentation

- PR#88³⁷⁶⁷: Added the "Sphinx Developer's Guide" (doc/devguide.rst) which outlines the basic development process of the Sphinx project.
- Added a detailed "Installing Sphinx" document (doc/install.rst).

Bugs fixed

- PR#124³⁷⁶⁸: Fix paragraphs in versionmodified are ignored when it has no dangling paragraphs. Fix wrong html output (nested tag). Fix versionmodified is not translatable. Thanks to Nozomu Kaneko.
- PR#111³⁷⁶⁹: Respect add_autodoc_attrgetter() even when inherited-members is set. Thanks to A. Jesse Jiryu Davis.
- PR#97³⁷⁷⁰: Fix footnote handling in translated documents.
- Fix text writer not handling visit_legend for figure directive contents.
- Fix text builder not respecting wide/fullwidth characters: title underline width, table layout width and text wrap width.
- Fix leading space in LaTeX table header cells.
- #1132³⁷⁷¹: Fix LaTeX table output for multi-row cells in the first column.
- #1128³⁷⁷²: Fix Unicode errors when trying to format time strings with a non-standard locale.
- #1127³⁷⁷³: Fix traceback when autodoc tries to tokenize a non-Python file.
- #1126³⁷⁷⁴: Fix double-hyphen to en-dash conversion in wrong places such as command-line option names in LaTeX.
- #1123³⁷⁷⁵: Allow whitespaces in filenames given to *literalinclude*.
- #1120³⁷⁷⁶: Added improvements about i18n for themes "basic", "haiku" and "scrolls" that Sphinx built-in. Thanks to Leonardo J. Caballero G.
- #1118³⁷⁷⁷: Updated Spanish translation. Thanks to Leonardo J. Caballero G.
- #1117³⁷⁷⁸: Handle .pyx files in sphinx-apidoc.
- #1112³⁷⁷⁹: Avoid duplicate download files when referenced from documents in different ways (absolute/relative).

- #1111³⁷⁸⁰: Fix failure to find uppercase words in search when *html_search_language* is 'ja'. Thanks to Tomo Saito.
- #1108³⁷⁸¹: The text writer now correctly numbers enumerated lists with non-default start values (based on patch by Ewan Edwards).
- #1102³⁷⁸²: Support multi-context "with" statements in autodoc.
- #1090³⁷⁸³: Fix gettext not extracting glossary terms.
- #1074³⁷⁸⁴: Add environment version info to the generated search index to avoid compatibility issues with old builds.
- #1070³⁷⁸⁵: Avoid un-pickling issues when running Python 3 and the saved environment was created under Python 2.
- #1069³⁷⁸⁶: Fixed error caused when autodoc would try to format signatures of "partial" functions without keyword arguments (patch by Artur Gaspar).
- #1062³⁷⁸⁷: sphinx.ext.autodoc use __init__ method signature for class signature.
- #1055³⁷⁸⁸: Fix web support with relative path to source directory.
- #1043³⁷⁸⁹: Fix sphinx-quickstart asking again for yes/no questions because input() returns values with an extra 'r' on Python 3.2.0 + Windows. Thanks to Régis Décamps.
- #1041³⁷⁹⁰: Fix failure of the cpp domain parser to parse a const type with a modifier.
- #1038³⁷⁹¹: Fix failure of the cpp domain parser to parse C+11 "static constexpr" declarations. Thanks to Jakub Wilk.
- #1029³⁷⁹²: Fix intersphinx_mapping values not being stable if the mapping has plural key/value set with Python 3.3.
- #1028³⁷⁹³: Fix line block output in the text builder.
- #1024³⁷⁹⁴: Improve Makefile/make.bat error message if Sphinx is not found. Thanks to Anatoly Techtonik.
- #1018³⁷⁹⁵: Fix "container" directive handling in the text builder.
- #1015³⁷⁹⁶: Stop overriding jQuery contains() in the JavaScript.
- #1010³⁷⁹⁷: Make pngmath images transparent by default; IE7+ should handle it.
- #1008³⁷⁹⁸: Fix test failures with Python 3.3.
- #995³⁷⁹⁹: Fix table-of-contents and page numbering for the LaTeX "howto" class.

- #976³⁸⁰⁰: Fix gettext does not extract index entries.
- PR#72³⁸⁰¹: #975³⁸⁰²: Fix gettext not extracting definition terms before Docutils 0.10.
- #961³⁸⁰³: Fix LaTeX output for triple quotes in code snippets.
- #958³⁸⁰⁴: Do not preserve environment.pickle after a failed build.
- #955³⁸⁰⁵: Fix i18n transformation.
- #940³⁸⁰⁶: Fix gettext does not extract figure caption.
- #920³⁸⁰⁷: Fix PIL packaging issue that allowed to import Image without PIL namespace. Thanks to Marc Schlaich.
- #723³⁸⁰⁸: Fix the search function on local files in WebKit based browsers.
- #440³⁸⁰⁹: Fix coarse timestamp resolution in some filesystem generating a wrong list of outdated files.

14.143 Release 1.1.3 (Mar 10, 2012)

- PR#40³⁸¹⁰: Fix safe_repr function to decode bytestrings with non-ASCII characters correctly.
- PR#37³⁸¹¹: Allow configuring sphinx-apidoc via SPHINX_APIDOC_OPTIONS.
- PR#34³⁸¹²: Restore Python 2.4 compatibility.
- PR#36³⁸¹³: Make the "bibliography to TOC" fix in LaTeX output specific to the document class.
- #695³⁸¹⁴: When the highlight language "python" is specified explicitly, do not try to parse the code to recognize non-Python snippets.
- #859³⁸¹⁵: Fix exception under certain circumstances when not finding appropriate objects to link to.
- #860³⁸¹⁶: Do not crash when encountering invalid doctest examples, just emit a warning.
- #864³⁸¹⁷: Fix crash with some settings of modindex_common_prefix.
- #862³⁸¹⁸: Fix handling of -D and -A options on Python 3.
- #8513819: Recognize and warn about circular toctrees, instead of running into recursion errors,
- #853³⁸²⁰: Restore compatibility with Docutils trunk.

- #852³⁸²¹: Fix HtmlHelp index entry links again.
- #854³⁸²²: Fix inheritance_diagram raising attribute errors on builtins.
- #832³⁸²³: Fix crashes when putting comments or lone terms in a glossary.
- #834³⁸²⁴, #818³⁸²⁵: Fix HTML help language/encoding mapping for all Sphinx supported languages.
- #844³⁸²⁶: Fix crashes when dealing with Unicode output in doctest extension.
- #831³⁸²⁷: Provide --project flag in setup_command as advertised.
- #875³⁸²⁸: Fix reading config files under Python 3.
- #876³⁸²⁹: Fix quickstart test under Python 3.
- #870³⁸³⁰: Fix spurious KeyErrors when removing documents.
- #892³⁸³¹: Fix single-HTML builder misbehaving with the master document in a subdirectory.
- #873³⁸³²: Fix assertion errors with empty only directives.
- #816³⁸³³: Fix encoding issues in the Qt help builder.

14.144 Release 1.1.2 (Nov 1, 2011) – 1.1.1 is a silly version number anyway!

• #809³⁸³⁴: Include custom fixers in the source distribution.

14.145 Release 1.1.1 (Nov 1, 2011)

- #791³⁸³⁵: Fix QtHelp, DevHelp and HtmlHelp index entry links.
- #792³⁸³⁶: Include "sphinx-apidoc" in the source distribution.
- #797³⁸³⁷: Don't crash on a misformatted glossary.
- #801³⁸³⁸: Make intersphinx work properly without SSL support.
- #805³⁸³⁹: Make the Sphinx.add_index_to_domain method work correctly.

3839 https://github.com/sphinx-doc/sphinx/issues/805

• #780³⁸⁴⁰: Fix Python 2.5 compatibility.

14.146 Release 1.1 (Oct 9, 2011)

Incompatible changes

- The *py:module* directive doesn't output its platform option value anymore. (It was the only thing that the directive did output, and therefore quite inconsistent.)
- Removed support for old dependency versions; requirements are now:
 - Pygments >= 1.2
 - Docutils >= 0.7
 - Jinja2 >= 2.3

Features added

- Added Python 3.x support.
- New builders and subsystems:
 - Added a Texinfo builder.
 - Added i18n support for content, a gettext builder and related utilities.
 - Added the websupport library and builder.
 - #98³⁸⁴¹: Added a sphinx-apidoc script that autogenerates a hierarchy of source files containing autodoc directives to document modules and packages.
 - #273³⁸⁴²: Add an API for adding full-text search support for languages other than English. Add support for Japanese.
- Markup:
 - #138³⁸⁴³: Added an *index* role, to make inline index entries.
 - #454³⁸⁴⁴: Added more index markup capabilities: marking see/seealso entries, and main entries for a given key.
 - #460³⁸⁴⁵: Allowed limiting the depth of section numbers for HTML using the *toctree*'s numbered option.
 - #586³⁸⁴⁶: Implemented improved glossary markup which allows multiple terms per definition.
 - #478³⁸⁴⁷: Added *py:decorator* directive to describe decorators.
 - C++ domain now supports array definitions.
 - C++ domain now supports doc fields (:param x: inside directives).
 - Section headings in *only* directives are now correctly handled.

³⁸⁴¹ https://github.com/sphinx-doc/sphinx/issues/98

³⁸⁴² https://github.com/sphinx-doc/sphinx/issues/273

³⁸⁴³ https://github.com/sphinx-doc/sphinx/issues/138

³⁸⁴⁴ https://github.com/sphinx-doc/sphinx/issues/454

³⁸⁴⁵ https://github.com/sphinx-doc/sphinx/issues/460

³⁸⁴⁶ https://github.com/sphinx-doc/sphinx/issues/586

³⁸⁴⁷ https://github.com/sphinx-doc/sphinx/issues/478

- Added emphasize-lines option to source code directives.
- #678³⁸⁴⁸: C++ domain now supports superclasses.

• HTML builder:

- Added pyramid theme.
- #559³⁸⁴⁹: html_add_permalinks is now a string giving the text to display in permalinks.
- #259³⁸⁵⁰: HTML table rows now have even/odd CSS classes to enable "Zebra styling".
- #554³⁸⁵¹: Add theme option sidebarwidth to the basic theme.

• Other builders:

- #516³⁸⁵²: Added new value of the latex_show_urls option to show the URLs in footnotes.
- #209³⁸⁵³: Added text_newlines and text_sectionchars config values.
- Added man_show_urls config value.
- #472³⁸⁵⁴: linkcheck builder: Check links in parallel, use HTTP HEAD requests and allow configuring the timeout. New config values: linkcheck_timeout and linkcheck_workers.
- #521³⁸⁵⁵: Added *linkcheck_ignore* config value.
- #28³⁸⁵⁶: Support row/colspans in tables in the LaTeX builder.
- Configuration and extensibility:
 - #537³⁸⁵⁷: Added nitpick_ignore.
 - #306³⁸⁵⁸: Added env-get-outdated event.
 - Application.add_stylesheet() now accepts full URIs.

• Autodoc:

- #564³⁸⁵⁹: Add autodoc_docstring_signature. When enabled (the default), autodoc retrieves the signature from the first line of the docstring, if it is found there.
- #176³⁸⁶⁰: Provide private-members option for autodoc directives.
- #520³⁸⁶¹: Provide special-members option for autodoc directives.
- #431³⁸⁶²: Doc comments for attributes can now be given on the same line as the assignment.
- #437³⁸⁶³: autodoc now shows values of class data attributes.
- autodoc now supports documenting the signatures of functools.partial objects.

• Other extensions:

3862 https://github.com/sphinx-doc/sphinx/issues/431
3863 https://github.com/sphinx-doc/sphinx/issues/437
```

- Added the *sphinx.ext.mathjax* extension.
- #443³⁸⁶⁴: Allow referencing external graphviz files.
- Added inline option to graphviz directives, and fixed the default (block-style) in LaTeX output.
- #590³⁸⁶⁵: Added caption option to graphviz directives.
- #553³⁸⁶⁶: Added testcleanup blocks in the doctest extension.
- #594³⁸⁶⁷: trim_doctest_flags now also removes <BLANKLINE> indicators.
- #367³⁸⁶⁸: Added automatic exclusion of hidden members in inheritance diagrams, and an option to selectively enable it.
- Added pngmath_add_tooltips.
- The math extension displaymath directives now support name in addition to label for giving the equation label, for compatibility with Docutils.
- · New locales:
 - #221³⁸⁶⁹: Added Swedish locale.
 - #526³⁸⁷⁰: Added Iranian locale.
 - #694³⁸⁷¹: Added Latvian locale.
 - Added Nepali locale.
 - #714³⁸⁷²: Added Korean locale.
 - #766³⁸⁷³: Added Estonian locale.
- Bugs fixed:
 - #778³⁸⁷⁴: Fix "hide search matches" link on pages linked by search.
 - Fix the source positions referenced by the "viewcode" extension.

14.147 Release 1.0.8 (Sep 23, 2011)

- #627³⁸⁷⁵: Fix tracebacks for AttributeErrors in autosummary generation.
- Fix the abbr role when the abbreviation has newlines in it.
- #727³⁸⁷⁶: Fix the links to search results with custom object types.
- #648³⁸⁷⁷: Fix line numbers reported in warnings about undefined references.

³⁸⁷⁷ https://github.com/sphinx-doc/sphinx/issues/648

- #696³⁸⁷⁸, #666³⁸⁷⁹: Fix C++ array definitions and template arguments that are not type names.
- #633³⁸⁸⁰: Allow footnotes in section headers in LaTeX output.
- #616³⁸⁸¹: Allow keywords to be linked via intersphinx.
- #613³⁸⁸²: Allow Unicode characters in production list token names.
- #720³⁸⁸³: Add dummy visitors for graphviz nodes for text and man.
- #704³⁸⁸⁴: Fix image file duplication bug.
- #677³⁸⁸⁵: Fix parsing of multiple signatures in C++ domain.
- #637³⁸⁸⁶: Ignore Emacs lock files when looking for source files.
- #544³⁸⁸⁷: Allow .pyw extension for importable modules in autodoc.
- #700³⁸⁸⁸: Use \$(MAKE) in quickstart-generated Makefiles.
- #734³⁸⁸⁹: Make sidebar search box width consistent in browsers.
- #644³⁸⁹⁰: Fix spacing of centered figures in HTML output.
- #767³⁸⁹¹: Safely encode SphinxError messages when printing them to sys.stderr.
- #611³⁸⁹²: Fix LaTeX output error with a document with no sections but a link target.
- Correctly treat built-in method descriptors as methods in autodoc.
- #706³⁸⁹³: Stop monkeypatching the Python textwrap module.
- #657³⁸⁹⁴: viewcode now works correctly with source files that have non-ASCII encoding.
- #669³⁸⁹⁵: Respect the noindex flag option in py:module directives.
- #675³⁸⁹⁶: Fix IndexErrors when including nonexisting lines with *literalinclude*.
- #676³⁸⁹⁷: Respect custom function/method parameter separator strings.
- $\#682^{3898}$: Fix JS incompatibility with jOuery >= 1.5.
- #693³⁸⁹⁹: Fix double encoding done when writing HTMLHelp .hhk files.
- #647³⁹⁰⁰: Do not apply SmartyPants in parsed-literal blocks.

```

• C++ domain now supports array definitions.

14.148 Release 1.0.7 (Jan 15, 2011)

- #347³⁹⁰¹: Fix wrong generation of directives of static methods in autosummary.
- #599³⁹⁰²: Import PIL as from PIL import Image.
- #558³⁹⁰³: Fix longtables with captions in LaTeX output.
- Make token references work as hyperlinks again in LaTeX output.
- #572³⁹⁰⁴: Show warnings by default when reference labels cannot be found.
- #536³⁹⁰⁵: Include line number when complaining about missing reference targets in nitpicky mode.
- #590³⁹⁰⁶: Fix inline display of graphviz diagrams in LaTeX output.
- #589³⁹⁰⁷: Build using app.build() in setup command.
- Fix a bug in the inheritance diagram exception that caused base classes to be skipped if one of them is a builtin.
- Fix general index links for C++ domain objects.
- #332³⁹⁰⁸: Make admonition boundaries in LaTeX output visible.
- #573³⁹⁰⁹: Fix KeyErrors occurring on rebuild after removing a file.
- Fix a traceback when removing files with globbed toctrees.
- If an autodoc object cannot be imported, always re-read the document containing the directive on next build.
- If an autodoc object cannot be imported, show the full traceback of the import error.
- Fix a bug where the removal of download files and images wasn't noticed.
- $#571^{3910}$: Implement ~ cross-reference prefix for the C domain.
- Fix regression of LaTeX output with the fix of #556³⁹¹¹.
- #568³⁹¹²: Fix lookup of class attribute documentation on descriptors so that comment documentation now works.
- Fix traceback with only directives preceded by targets.
- Fix tracebacks occurring for duplicate C++ domain objects.
- Fix JavaScript domain links to objects with \$ in their name.

14.149 Release 1.0.6 (Jan 04, 2011)

- #581³⁹¹³: Fix traceback in Python domain for empty cross-reference targets.
- #283³⁹¹⁴: Fix literal block display issues on Chrome browsers.
- #383³⁹¹⁵, #148³⁹¹⁶: Support sorting a limited range of accented characters in the general index and the glossary.
- #570³⁹¹⁷: Try decoding -D and -A command-line arguments with the locale's preferred encoding.
- #528³⁹¹⁸: Observe *locale_dirs* when looking for the JS translations file.
- #574³⁹¹⁹: Add special code for better support of Japanese documents in the LaTeX builder.
- Regression of #77³⁹²⁰: If there is only one parameter given with :param: markup, the bullet list is now suppressed again.
- #556³⁹²¹: Fix missing paragraph breaks in LaTeX output in certain situations.
- #567³⁹²²: Emit the autodoc-process-docstring event even for objects without a docstring so that it can add content.
- #565³⁹²³: In the LaTeX builder, not only literal blocks require different table handling, but also quite a few other list-like block elements.
- #515³⁹²⁴: Fix tracebacks in the viewcode extension for Python objects that do not have a valid signature.
- Fix strange reports of line numbers for warnings generated from autodoc-included docstrings, due to different behavior depending on Docutils version.
- Several fixes to the C++ domain.

14.150 Release 1.0.5 (Nov 12, 2010)

- #557³⁹²⁵: Add CSS styles required by Docutils 0.7 for aligned images and figures.
- In the Makefile generated by LaTeX output, do not delete pdf files on clean; they might be required images.
- #535³⁹²⁶: Fix LaTeX output generated for line blocks.
- #544³⁹²⁷: Allow .pyw as a source file extension.

14.151 Release 1.0.4 (Sep 17, 2010)

- #524³⁹²⁸: Open intersphinx inventories in binary mode on Windows, since version 2 contains zlib-compressed data.
- #513³⁹²⁹: Allow giving non-local URIs for JavaScript files, e.g. in the JSMath extension.
- #512³⁹³⁰: Fix traceback when intersphinx_mapping is empty.

14.152 Release 1.0.3 (Aug 23, 2010)

- #495³⁹³¹: Fix internal vs. external link distinction for links coming from a Docutils table-of-contents.
- #494³⁹³²: Fix the maxdepth option for the toctree() template callable when used with collapse=True.
- #507³⁹³³: Fix crash parsing Python argument lists containing brackets in string literals.
- #501³⁹³⁴: Fix regression when building LaTeX docs with figures that don't have captions.
- #510³⁹³⁵: Fix inheritance diagrams for classes that are not picklable.
- #497³⁹³⁶: Introduce separate background color for the sidebar collapse button, making it easier to see.
- $#502^{3937}$, $#503^{3938}$, $#496^{3939}$: Fix small layout bugs in several builtin themes.

14.153 Release 1.0.2 (Aug 14, 2010)

- #490³⁹⁴⁰: Fix cross-references to objects of types added by the add_object_type() API function.
- Fix handling of doc field types for different directive types.
- Allow breaking long signatures, continuing with backlash-escaped newlines.
- Fix unwanted styling of C domain references (because of a namespace clash with Pygments styles).
- Allow references to PEPs and RFCs with explicit anchors.
- #471³⁹⁴¹: Fix LaTeX references to figures.
- #482³⁹⁴²: When doing a non-exact search, match only the given type of object.
- #481³⁹⁴³: Apply non-exact search for Python reference targets with .name for modules too.

³⁹⁴³ https://github.com/sphinx-doc/sphinx/issues/481

- #484³⁹⁴⁴: Fix crash when duplicating a parameter in an info field list.
- #487³⁹⁴⁵: Fix setting the default role to one provided by the oldcmarkup extension.
- #488³⁹⁴⁶: Fix crash when json-py is installed, which provides a json module but is incompatible to simplejson.
- #480³⁹⁴⁷: Fix handling of target naming in intersphinx.
- #486³⁹⁴⁸: Fix removal of ! for all cross-reference roles.

14.154 Release 1.0.1 (Jul 27, 2010)

- #470³⁹⁴⁹: Fix generated target names for reST domain objects; they are not in the same namespace.
- #266³⁹⁵⁰: Add Bengali language.
- #473³⁹⁵¹: Fix a bug in parsing JavaScript object names.
- #474³⁹⁵²: Fix building with SingleHTMLBuilder when there is no toctree.
- Fix display names for objects linked to by intersphinx with explicit targets.
- Fix building with the JSON builder.
- Fix hyperrefs in object descriptions for LaTeX.

14.155 Release 1.0 (Jul 23, 2010)

Incompatible changes

- Support for domains has been added. A domain is a collection of directives and roles that all describe objects belonging together, e.g. elements of a programming language. A few builtin domains are provided:
 - Python
 - C
 - C++
 - JavaScript
 - reStructuredText
- The old markup for defining and linking to C directives is now deprecated. It will not work anymore in future versions without activating the oldcmarkup extension; in Sphinx 1.0, it is activated by default.
- Removed support for old dependency versions; requirements are now:
 - Docutils >= 0.5
 - Jinja2 >= 2.2

³⁹⁴⁴ https://github.com/sphinx-doc/sphinx/issues/484

³⁹⁴⁵ https://github.com/sphinx-doc/sphinx/issues/487

³⁹⁴⁶ https://github.com/sphinx-doc/sphinx/issues/488

³⁹⁴⁸ https://github.com/sphinx-doc/sphinx/issues/486

³⁹⁴⁹ https://github.com/sphinx-doc/sphinx/issues/470

³⁹⁵⁰ https://github.com/sphinx-doc/sphinx/issues/266

³⁹⁵¹ https://github.com/sphinx-doc/sphinx/issues/473

³⁹⁵² https://github.com/sphinx-doc/sphinx/issues/474

- Removed deprecated elements:
 - exclude_dirs config value
 - sphinx.builder module

Features added

- · General:
 - Added a "nitpicky" mode that emits warnings for all missing references. It is activated by the *sphinx-build -n* command-line switch or the *nitpicky* config value.
 - Added latexpdf target in quickstart Makefile.
- Markup:
 - The menuselection and guilabel roles now support ampersand accelerators.
 - New more compact doc field syntax is now recognized: :param type name: description.
 - Added tab-width option to *literalinclude* directive.
 - Added titlesonly option to toctree directive.
 - Added the prepend and append options to the literalinclude directive.
 - #284³⁹⁵³: All docinfo metadata is now put into the document metadata, not just the author.
 - The *ref* role can now also reference tables by caption.
 - The include³⁹⁵⁴ directive now supports absolute paths, which are interpreted as relative to the source directory.
 - In the Python domain, references like: func:`.name` now look for matching names with any prefix if no direct match is found.
- Configuration:
 - Added rst_prolog config value.
 - Added html_secnumber_suffix config value to control section numbering format.
 - Added <a href="https://https
 - The html_sidebars config value can now contain patterns as keys, and the values can be lists that explicitly select which sidebar templates should be rendered. That means that the builtin sidebar contents can be included only selectively.
 - html_static_path can now contain single file entries.
 - The new universal config value exclude_patterns makes the old unused_docs, exclude_trees and exclude_dirnames obsolete.
 - Added html_output_encoding config value.
 - Added the latex_docclass config value and made the "twoside" documentclass option overridable by "oneside".
 - Added the trim_doctest_flags config value, which is true by default.
 - Added html_show_copyright config value.
 - Added latex_show_pagerefs and latex_show_urls config values.

³⁹⁵³ https://github.com/sphinx-doc/sphinx/issues/284

³⁹⁵⁴ https://docutils.sourceforge.io/docs/ref/rst/directives.html#include

- The behavior of https://linear.com/https:

· New builders:

- Added a builder for the Epub format.
- Added a builder for manual pages.
- Added a single-file HTML builder.

• HTML output:

- Inline roles now get a CSS class with their name, allowing styles to customize their appearance. Domain-specific roles get two classes, domain and domain-rolename.
- References now get the class internal if they are internal to the whole project, as opposed to internal to the current page.
- External references can be styled differently with the new externalrefs theme option for the default theme.
- In the default theme, the sidebar can experimentally now be made collapsible using the new collapsiblesidebar theme option.
- #129³⁹⁵⁵: Toctrees are now wrapped in a div tag with class toctree-wrapper in HTML output.
- The *toctree* callable in templates now has a maxdepth keyword argument to control the depth of the generated tree.
- The *toctree* callable in templates now accepts a titles_only keyword argument.
- Added htmltitle block in layout template.
- In the JavaScript search, allow searching for object names including the module name, like sys.argv.
- Added new theme haiku, inspired by the Haiku OS user guide.
- Added new theme nature.
- Added new theme agogo, created by Andi Albrecht.
- Added new theme scrolls, created by Armin Ronacher.
- #193³⁹⁵⁶: Added a visitedlinkcolor theme option to the default theme.
- #322³⁹⁵⁷: Improved responsiveness of the search page by loading the search index asynchronously.

• Extension API:

- Added html-collect-pages.
- Added needs_sphinx config value and require_sphinx() application API method.
- #200³⁹⁵⁸: Added add_stylesheet() application API method.

• Extensions:

- Added the viewcode extension.
- Added the extlinks extension.
- Added support for source ordering of members in autodoc, with autodoc_member_order = 'bysource'.

³⁹⁵⁵ https://github.com/sphinx-doc/sphinx/issues/129

³⁹⁵⁶ https://github.com/sphinx-doc/sphinx/issues/193

³⁹⁵⁷ https://github.com/sphinx-doc/sphinx/issues/322

³⁹⁵⁸ https://github.com/sphinx-doc/sphinx/issues/200

- Added autodoc_default_flags config value, which can be used to select default flags for all autodoc directives.
- Added a way for intersphinx to refer to named labels in other projects, and to specify the project you want to link to.
- #280³⁹⁵⁹: Autodoc can now document instance attributes assigned in __init__ methods.
- Many improvements and fixes to the *autosummary* extension, thanks to Pauli Virtanen.
- #309³⁹⁶⁰: The *graphviz* extension can now output SVG instead of PNG images, controlled by the *graphviz_output_format* config value.
- Added alt option to *graphviz* extension directives.
- Added exclude argument to autodoc.between().

• Translations:

- Added Croatian translation, thanks to Bojan Mihelač.
- Added Turkish translation, thanks to Firat Ozgul.
- Added Catalan translation, thanks to Pau Fernández.
- Added simplified Chinese translation.
- Added Danish translation, thanks to Hjorth Larsen.
- Added Lithuanian translation, thanks to Dalius Dobravolskas.

• Bugs fixed:

- #445³⁹⁶¹: Fix links to result pages when using the search function of HTML built with the dirhtml builder.
- #444³⁹⁶²: In templates, properly re-escape values treated with the "striptags" Jinja filter.

14.156 Release 0.6.7 (Jun 05, 2010)

- $\#440^{3963}$: Remove usage of a Python >= 2.5 API in the literalinelude directive.
- Fix a bug that prevented some references being generated in the LaTeX builder.
- #428³⁹⁶⁴: Add some missing CSS styles for standard Docutils classes.
- #432³⁹⁶⁵: Fix UnicodeErrors while building LaTeX in translated locale.

14.157 Release 0.6.6 (May 25, 2010)

- Handle raw nodes in the text writer.
- Fix a problem the Qt help project generated by the qthelp builder that would lead to no content being displayed in the Qt Assistant.
- #393³⁹⁶⁶: Fix the usage of Unicode characters in mathematic formulas when using the pngmath extension.
- #404³⁹⁶⁷: Make \and work properly in the author field of the latex_documents setting.
- #409³⁹⁶⁸: Make the highlight_language config value work properly in the LaTeX builder.
- #418³⁹⁶⁹: Allow relocation of the translation JavaScript files to the system directory on Unix systems.
- #414³⁹⁷⁰: Fix handling of Windows newlines in files included with the literalinclude directive.
- #377³⁹⁷¹: Fix crash in linkcheck builder.
- #387³⁹⁷²: Fix the display of search results in dirhtml output.
- #376³⁹⁷³: In autodoc, fix display of parameter defaults containing backslashes.
- #370³⁹⁷⁴: Fix handling of complex list item labels in LaTeX output.
- #374³⁹⁷⁵: Make the doctest_path config value of the doctest extension actually work.
- Fix the handling of multiple toctrees when creating the global TOC for the toctree() template function.
- Fix the handling of hidden toctrees when creating the global TOC for the toctree() template function.
- Fix the handling of nested lists in the text writer.
- #362³⁹⁷⁶: In autodoc, check for the existence of __self__ on function objects before accessing it.
- #353³⁹⁷⁷: Strip leading and trailing whitespace when extracting search words in the search function.

14.158 Release 0.6.5 (Mar 01, 2010)

- In autodoc, fix the omission of some module members explicitly documented using documentation comments.
- #345³⁹⁷⁸: Fix cropping of sidebar scroll bar with stickysidebar option of the default theme.
- #341³⁹⁷⁹: Always generate UNIX newlines in the quickstart Makefile.
- #338³⁹⁸⁰: Fix running with -C under Windows.
- In autodoc, allow customizing the signature of an object where the built-in mechanism fails.

https://github.com/sphinx-doc/sphinx/issues/341
```

3980 https://github.com/sphinx-doc/sphinx/issues/338

- #331³⁹⁸¹: Fix output for enumerated lists with start values in LaTeX.
- Make the start-after and end-before options to the literalinclude directive work correctly if not used together.
- #321³⁹⁸²: Fix link generation in the LaTeX builder.

14.159 Release 0.6.4 (Jan 12, 2010)

- Improve the handling of non-Unicode strings in the configuration.
- #316³⁹⁸³: Catch OSErrors occurring when calling graphviz with arguments it doesn't understand.
- Restore compatibility with Pygments >= 1.2.
- #295³⁹⁸⁴: Fix escaping of hyperref targets in LaTeX output.
- #302³⁹⁸⁵: Fix links generated by the :doc: role for LaTeX output.
- #286³⁹⁸⁶: collect todo nodes after the whole document has been read; this allows placing substitution references in todo items.
- #294³⁹⁸⁷: do not ignore an explicit today config value in a LaTeX build.
- The alt text of inheritance diagrams is now much cleaner.
- Ignore images in section titles when generating link captions.
- #310³⁹⁸⁸: support exception messages in the testoutput blocks of the doctest extension.
- #293³⁹⁸⁹: line blocks are styled properly in HTML output.
- #285³⁹⁹⁰: make the locale_dirs config value work again.
- #303³⁹⁹¹: html_context values given on the command line via -A should not override other values given in conf.py.
- Fix a bug preventing incremental rebuilds for the dirhtml builder.
- #299³⁹⁹²: Fix the mangling of quotes in some literal blocks.
- #292³⁹⁹³: Fix path to the search index for the dirhtml builder.
- Fix a Jython compatibility issue: make the dependence on the parser module optional.
- #238³⁹⁹⁴: In autodoc, catch all errors that occur on module import, not just ImportError.
- Fix the handling of non-data, but non-method descriptors in autodoc.
- When copying file times, ignore OSErrors raised by os.utime().

14.160 Release 0.6.3 (Sep 03, 2009)

- Properly add C module filenames as dependencies in autodoc.
- #253³⁹⁹⁵: Ignore graphviz directives without content instead of raising an unhandled exception.
- #241³⁹⁹⁶: Fix a crash building LaTeX output for documents that contain a todolist directive.
- #252³⁹⁹⁷: Make it easier to change the build dir in the Makefiles generated by quickstart.
- #220³⁹⁹⁸: Fix CSS so that displaymath really is centered.
- #222³⁹⁹⁹: Allow the "Footnotes" header to be translated.
- #225⁴⁰⁰⁰: Don't add whitespace in generated HTML after inline tags.
- #227⁴⁰⁰¹: Make literalinclude work when the document's path name contains non-ASCII characters.
- #229⁴⁰⁰²: Fix autodoc failures with members that raise errors on getattr().
- #205⁴⁰⁰³: When copying files, don't copy full stat info, only modification times.
- #232⁴⁰⁰⁴: Support non-ASCII metadata in Qt help builder.
- Properly format bullet lists nested in definition lists for LaTeX.
- Section titles are now allowed inside only directives.
- #2014005: Make centered directive work in LaTeX output.
- #206⁴⁰⁰⁶: Refuse to overwrite an existing master document in sphinx-quickstart.
- #208⁴⁰⁰⁷: Use MS-sanctioned locale settings, determined by the language config option, in the HTML help builder.
- #210⁴⁰⁰⁸: Fix nesting of HTML tags for displayed math from pngmath extension.
- #213⁴⁰⁰⁹: Fix centering of images in LaTeX output.
- #211⁴⁰¹⁰: Fix compatibility with Docutils 0.5.

14.161 Release 0.6.2 (Jun 16, 2009)

- #130⁴⁰¹¹: Fix obscure IndexError in doctest extension.
- #167⁴⁰¹²: Make glossary sorting case-independent.
- #196⁴⁰¹³: Add a warning if an extension module doesn't have a setup() function.
- #158⁴⁰¹⁴: Allow '..' in template names, and absolute template paths; Jinja 2 by default disables both.
- When highlighting Python code, ignore extra indentation before trying to parse it as Python.
- #191⁴⁰¹⁵: Don't escape the tilde in URIs in LaTeX.
- Don't consider contents of source comments for the search index.
- Set the default encoding to utf-8-sig to handle files with a UTF-8 BOM correctly.
- #178⁴⁰¹⁶: apply add_function_parentheses config value to C functions as promised.
- #173⁴⁰¹⁷: Respect the Docutils title directive.
- #172⁴⁰¹⁸: The obj role now links to modules as promised.
- #19⁴⁰¹⁹: Tables now can have a "longtable" class, in order to get correctly broken into pages in LaTeX output.
- Look for Sphinx message catalogs in the system default path before trying sphinx/locale.
- Fix the search for methods via "classname.methodname".
- #155⁴⁰²⁰: Fix Python 2.4 compatibility: exceptions are old-style classes there.
- #150⁴⁰²¹: Fix display of the "sphinxdoc" theme on Internet Explorer versions 6 and 7.
- #146⁴⁰²²: Don't fail to generate LaTeX when the user has an active .docutils configuration.
- #29⁴⁰²³: Don't generate visible "-{-}" in option lists in LaTeX.
- Fix cross-reference roles when put into substitutions.
- Don't put image "alt" text into table-of-contents entries.
- In the LaTeX writer, do not raise an exception on too many section levels, just use the "subparagraph" level for all of them.
- #145⁴⁰²⁴: Fix autodoc problem with automatic members that refuse to be getattr()'d from their parent.
- If specific filenames to build are given on the command line, check that they are within the source directory.
- Fix autodoc crash for objects without a __name__.
- Fix intersphinx for installations without urllib2.HTTPSHandler.

• #134⁴⁰²⁵: Fix pending_xref leftover nodes when using the todolist directive from the todo extension.

14.162 Release 0.6.1 (Mar 26, 2009)

- #135⁴⁰²⁶: Fix problems with LaTeX output and the graphviz extension.
- #132⁴⁰²⁷: Include the autosummary "module" template in the distribution.

14.163 Release 0.6 (Mar 24, 2009)

New features added

- Incompatible changes:
 - Templating now requires the Jinja2 library, which is an enhanced version of the old Jinja1 engine. Since the syntax and semantic is largely the same, very few fixes should be necessary in custom templates.
 - The "document" div tag has been moved out of the layout.html template's "document" block, because
 the closing tag was already outside. If you overwrite this block, you need to remove your "document" div
 tag as well.
 - The autodoc_skip_member event now also gets to decide whether to skip members whose name starts with underscores. Previously, these members were always automatically skipped. Therefore, if you handle this event, add something like this to your event handler to restore the old behavior:

```
if name.startswith('_'):
    return True
```

- Theming support, see the new section in the documentation.
- Markup:
 - Due to popular demand, added a :doc: role which directly links to another document without the need of creating a label to which a :ref: could link to.
 - #4⁴⁰²⁸: Added a :download: role that marks a non-document file for inclusion into the HTML output and links to it.
 - Added an only directive that can selectively include text based on enabled "tags". Tags can be given on the command line. Also, the current builder output format (e.g. "html" or "latex") is always a defined tag.
 - #10⁴⁰²⁹: Added HTML section numbers, enabled by giving a :numbered: flag to the toctree directive.
 - #114⁴⁰³⁰: Added an abbr role to markup abbreviations and acronyms.
 - The literalinclude directive now supports several more options, to include only parts of a file.
 - The toctree directive now supports a :hidden: flag, which will prevent links from being generated in place of the directive this allows you to define your document structure, but place the links yourself.
 - #123⁴⁰³¹: The glossary directive now supports a : sorted: flag that sorts glossary entries alphabetically.

⁴⁰²⁶ https://github.com/sphinx-doc/sphinx/issues/135

⁴⁰²⁷ https://github.com/sphinx-doc/sphinx/issues/132

⁴⁰²⁸ https://github.com/sphinx-doc/sphinx/issues/4

⁴⁰²⁹ https://github.com/sphinx-doc/sphinx/issues/10

⁴⁰³⁰ https://github.com/sphinx-doc/sphinx/issues/114

⁴⁰³¹ https://github.com/sphinx-doc/sphinx/issues/123

- Paths to images, literal include files and download files can now be absolute (like /images/foo.png).
 They are treated as relative to the top source directory.
- #52⁴⁰³²: There is now a hlist directive, creating a compact list by placing distributing items into multiple columns.
- #77⁴⁰³³: If a description environment with info field list only contains one :param: entry, no bullet list is generated.
- #6⁴⁰³⁴: Don't generate redundant
 for top-level TOC tree items, which leads to a visual separation of TOC entries.
- #23⁴⁰³⁵: Added a classmethod directive along with method and staticmethod.
- Scaled images now get a link to the unscaled version.
- SVG images are now supported in HTML (via <object> and <embed> tags).
- Added a toctree callable to the templates, and the ability to include external links in toctrees. The 'collapse' keyword argument indicates whether or not to only display subitems of the current page. (Defaults to True.)

• Configuration:

- The new config value rst_epilog can contain reST that is appended to each source file that is read. This is the right place for global substitutions.
- The new html_add_permalinks config value can be used to switch off the generated "paragraph sign" permalinks for each heading and definition environment.
- The new html_show_sourcelink config value can be used to switch off the links to the reST sources in the sidebar.
- The default value for htmlhelp_basename is now the project title, cleaned up as a filename.
- The new modindex_common_prefix config value can be used to ignore certain package names for module index sorting.
- The new trim_footnote_reference_space config value mirrors the Docutils config value of the same name and removes the space before a footnote reference that is necessary for reST to recognize the reference.
- The new latex_additional_files config value can be used to copy files (that Sphinx doesn't copy automatically, e.g. if they are referenced in custom LaTeX added in latex_elements) to the build directory.

• Builders:

- The HTML builder now stores a small file named .buildinfo in its output directory. It stores a hash of config values that can be used to determine if a full rebuild needs to be done (e.g. after changing html_theme).
- New builder for Qt help collections, by Antonio Valentino.
- The new DirectoryHTMLBuilder (short name dirhtml) creates a separate directory for every page, and places the page there in a file called index.html. Therefore, page URLs and links don't need to contain .html.
- The new html_link_suffix config value can be used to select the suffix of generated links between HTML files.
- #96⁴⁰³⁶: The LaTeX builder now supports figures wrapped by text, when using the figwidth option and right/left alignment.

⁴⁰³⁵ https://github.com/sphinx-doc/sphinx/issues/23

⁴⁰³⁶ https://github.com/sphinx-doc/sphinx/issues/96

• New translations:

- Italian by Sandro Dentella.
- Ukrainian by Petro Sasnyk.
- Finnish by Jukka Inkeri.
- Russian by Alexander Smishlajev.

• Extensions and API:

- New graphviz extension to embed graphviz graphs.
- New inheritance_diagram extension to embed... inheritance diagrams!
- New autosummary extension that generates summaries of modules and automatic documentation of modules.
- Autodoc now has a reusable Python API, which can be used to create custom types of objects to autodocument (e.g. Zope interfaces). See also Sphinx.add_autodocumenter().
- Autodoc now handles documented attributes.
- Autodoc now handles inner classes and their methods.
- Autodoc can document classes as functions now if explicitly marked with autofunction.
- Autodoc can now exclude single members from documentation via the exclude-members option.
- Autodoc can now order members either alphabetically (like previously) or by member type; configurable either with the config value autodoc_member_order or a member-order option per directive.
- The function Sphinx.add_directive() now also supports Docutils 0.5-style directive classes. If they inherit from sphinx.util.compat.Directive, they also work with Docutils 0.4.
- There is now a Sphinx.add_lexer() method to be able to use custom Pygments lexers easily.
- There is now Sphinx.add_generic_role() to mirror the Docutils' own function.

· Other changes:

- Config overrides for single dict keys can now be given on the command line.
- There is now a doctest_global_setup config value that can be used to give setup code for all doctests in the documentation.
- Source links in HTML are now generated with rel="nofollow".
- Quickstart can now generate a Windows make.bat file.
- #62⁴⁰³⁷: There is now a -w option for sphinx-build that writes warnings to a file, in addition to stderr.
- There is now a -W option for sphinx-build that turns warnings into errors.

⁴⁰³⁷ https://github.com/sphinx-doc/sphinx/issues/62

14.164 Release 0.5.2 (Mar 24, 2009)

- Properly escape | in LaTeX output.
- #71⁴⁰³⁸: If a decoding error occurs in source files, print a warning and replace the characters by "?".
- Fix a problem in the HTML search if the index takes too long to load.
- Don't output system messages while resolving, because they would stay in the doctrees even if keep_warnings is false.
- #82⁴⁰³⁹: Determine the correct path for dependencies noted by docutils. This fixes behavior where a source with dependent files was always reported as changed.
- Recognize toctree directives that are not on section toplevel, but within block items, such as tables.
- Use a new RFC base URL, since rfc.org seems down.
- Fix a crash in the todolist directive when no todo items are defined.
- Don't call LaTeX or dvipng over and over again if it was not found once, and use text-only latex as a substitute
 in that case.
- Fix problems with footnotes in the LaTeX output.
- Prevent double hyphens becoming en-dashes in literal code in the LaTeX output.
- Open literalinclude files in universal newline mode to allow arbitrary newline conventions.
- Actually make the -Q option work.
- #86⁴⁰⁴⁰: Fix explicit document titles in toctrees.
- #81⁴⁰⁴¹: Write environment and search index in a manner that is safe from exceptions that occur during dumping.
- #80⁴⁰⁴²: Fix UnicodeErrors when a locale is set with setlocale().

14.165 Release 0.5.1 (Dec 15, 2008)

- #67⁴⁰⁴³: Output warnings about failed doctests in the doctest extension even when running in quiet mode.
- #72⁴⁰⁴⁴: In pngmath, make it possible to give a full path to LaTeX and dvipng on Windows. For that to work, the pngmath_latex and pngmath_dvipng options are no longer split into command and additional arguments; use pngmath_latex_args and pngmath_dvipng_args to give additional arguments.
- Don't crash on failing doctests with non-ASCII characters.
- Don't crash on writing status messages and warnings containing unencodable characters.
- Warn if a doctest extension block doesn't contain any code.
- Fix the handling of :param: and :type: doc fields when they contain markup (especially cross-referencing roles).
- #65⁴⁰⁴⁵: Fix storage of depth information for PNGs generated by the pngmath extension.

⁴⁰³⁸ https://github.com/sphinx-doc/sphinx/issues/71

⁴⁰³⁹ https://github.com/sphinx-doc/sphinx/issues/82

⁴⁰⁴⁰ https://github.com/sphinx-doc/sphinx/issues/86

⁴⁰⁴¹ https://github.com/sphinx-doc/sphinx/issues/81

⁴⁰⁴² https://github.com/sphinx-doc/sphinx/issues/80

⁴⁰⁴³ https://github.com/sphinx-doc/sphinx/issues/67

⁴⁰⁴⁴ https://github.com/sphinx-doc/sphinx/issues/72

⁴⁰⁴⁵ https://github.com/sphinx-doc/sphinx/issues/65

- Fix autodoc crash when automethod is used outside a class context.
- #68⁴⁰⁴⁶: Fix LaTeX writer output for images with specified height.
- #60⁴⁰⁴⁷: Fix wrong generated image path when including images in sources in subdirectories.
- Fix the JavaScript search when html_copy_source is off.
- Fix an indentation problem in autodoc when documenting classes with the option autoclass_content = "both" set.
- Don't crash on empty index entries, only emit a warning.
- Fix a typo in the search JavaScript code, leading to unusable search function in some setups.

14.166 Release 0.5 (Nov 23, 2008) – Birthday release!

New features added

- Markup features:
 - Citations are now global: all citation defined in any file can be referenced from any file. Citations are collected in a bibliography for LaTeX output.
 - Footnotes are now properly handled in the LaTeX builder: they appear at the location of the footnote reference in text, not at the end of a section. Thanks to Andrew McNamara for the initial patch.
 - "System Message" warnings are now automatically removed from the built documentation, and only written to stderr. If you want the old behavior, set the new config value keep_warnings to True.
 - Glossary entries are now automatically added to the index.
 - Figures with captions can now be referred to like section titles, using the :ref: role without an explicit link text.
 - Added cmember role for consistency.
 - Lists enumerated by letters or roman numerals are now handled like in standard reST.
 - The seealso directive can now also be given arguments, as a short form.
 - You can now document several programs and their options with the new program directive.
- HTML output and templates:
 - Incompatible change: The "root" relation link (top left in the relbar) now points to the master_doc by default, no longer to a document called "index". The old behavior, while useful in some situations, was somewhat unexpected. Override the "rootrellink" block in the template to customize where it refers to.
 - The JavaScript search now searches for objects before searching in the full text.
 - TOC tree entries now have CSS classes that make it possible to style them depending on their depth.
 - Highlighted code blocks now have CSS classes that make it possible to style them depending on their language.
 - HTML <meta> tags via the Docutils meta⁴⁰⁴⁸ directive are now supported.

⁴⁰⁴⁶ https://github.com/sphinx-doc/sphinx/issues/68

⁴⁰⁴⁷ https://github.com/sphinx-doc/sphinx/issues/60

⁴⁰⁴⁸ https://docutils.sourceforge.io/docs/ref/rst/directives.html#meta

- SerializingHTMLBuilder was added as new abstract builder that can be subclassed to serialize build HTML in a specific format. The PickleHTMLBuilder is a concrete subclass of it that uses pickle as serialization implementation.
- JSONHTMLBuilder was added as another SerializingHTMLBuilder subclass that dumps the generated HTML into JSON files for further processing.
- The rellinks block in the layout template is now called linktags to avoid confusion with the relbar links.
- The HTML builders have two additional attributes now that can be used to disable the anchor-link creation after headlines and definition links.
- Only generate a module index if there are some modules in the documentation.
- New and changed config values:
 - Added support for internationalization in generated text with the language and locale_dirs config values. Many thanks to language contributors:
 - * Horst Gutmann German
 - * Pavel Kosina Czech
 - * David Larlet French
 - * Michał Kandulski Polish
 - * Yasushi Masuda Japanese
 - * Guillem Borrell Spanish
 - * Luc Saffre and Peter Bertels Dutch
 - * Fred Lin Traditional Chinese
 - * Roger Demetrescu Brazilian Portuguese
 - * Rok Garbas Slovenian
 - The new config value highlight_language set a global default for highlighting. When 'python3' is selected, console output blocks are recognized like for 'python'.
 - Exposed Pygments' lexer guessing as a highlight "language" guess.
 - The new config value latex_elements allows to override all LaTeX snippets that Sphinx puts into the generated .tex file by default.
 - Added exclude_dirnames config value that can be used to exclude e.g. CVS directories from source file search.
 - Added source_encoding config value to select input encoding.

• Extensions:

- The new extensions sphinx.ext.jsmath and sphinx.ext.pngmath provide math support for both HTML and LaTeX builders.
- The new extension sphinx.ext.intersphinx half-automatically creates links to Sphinx documentation of Python objects in other projects.
- The new extension sphinx.ext.todo allows the insertion of "To do" directives whose visibility in the output can be toggled. It also adds a directive to compile a list of all todo items.
- sphinx.ext.autodoc has a new event autodoc-process-signature that allows tuning function signature introspection.

- sphinx.ext.autodoc has a new event autodoc-skip-member that allows tuning which members are included in the generated content.
- Respect __all__ when autodocumenting module members.
- The automodule directive now supports the synopsis, deprecated and platform options.

• Extension API:

- Sphinx.add_node() now takes optional visitor methods for the HTML, LaTeX and text translators; this prevents having to manually patch the classes.
- Added Sphinx.add_javascript() that adds scripts to load in the default HTML template.
- Added new events: source-read, env-updated, env-purge-doc, missing-reference, build-finished.

• Other changes:

- Added a command-line switch -Q: it will suppress warnings.
- Added a command-line switch -A: it can be used to supply additional values into the HTML templates.
- Added a command-line switch -C: if it is given, no configuration file conf.py is required.
- Added a distutils command build_sphinx: When Sphinx is installed, you can call python setup.py build_sphinx for projects that have Sphinx documentation, which will build the docs and place them in the standard distutils build directory.
- In quickstart, if the selected root path already contains a Sphinx project, complain and abort.

Bugs fixed

- #51⁴⁰⁴⁹: Escape configuration values placed in HTML templates.
- #44⁴⁰⁵⁰: Fix small problems in HTML help index generation.
- Fix LaTeX output for line blocks in tables.
- #38⁴⁰⁵¹: Fix "illegal unit" error when using pixel image widths/heights.
- Support table captions in LaTeX output.
- #39⁴⁰⁵²: Work around a bug in Jinja that caused "<generator ...>" to be emitted in HTML output.
- Fix a problem with module links not being generated in LaTeX output.
- Fix the handling of images in different directories.
- #29⁴⁰⁵³: Support option lists in the text writer. Make sure that dashes introducing long option names are not contracted to en-dashes.
- Support the "scale" option for images in HTML output.
- #25⁴⁰⁵⁴: Properly escape quotes in HTML help attribute values.
- Fix LaTeX build for some description environments with :noindex:.
- #24⁴⁰⁵⁵: Don't crash on uncommon casing of role names (like :Class:).

⁴⁰⁴⁹ https://github.com/sphinx-doc/sphinx/issues/51

⁴⁰⁵⁰ https://github.com/sphinx-doc/sphinx/issues/44

⁴⁰⁵¹ https://github.com/sphinx-doc/sphinx/issues/38

⁴⁰⁵² https://github.com/sphinx-doc/sphinx/issues/39

⁴⁰⁵³ https://github.com/sphinx-doc/sphinx/issues/29

⁴⁰⁵⁴ https://github.com/sphinx-doc/sphinx/issues/25

⁴⁰⁵⁵ https://github.com/sphinx-doc/sphinx/issues/24

- Only output ANSI colors on color terminals.
- Update to newest fncychap.sty, to fix problems with non-ASCII characters at the start of chapter titles.
- Fix a problem with index generation in LaTeX output, caused by hyperref not being included last.
- Don't disregard return annotations for functions without any parameters.
- Don't throw away labels for code blocks.

14.167 Release 0.4.3 (Oct 8, 2008)

- Fix a bug in autodoc with directly given autodoc members.
- Fix a bug in autodoc that would import a module twice, once as "module", once as "module.".
- Fix a bug in the HTML writer that created duplicate id attributes for section titles with Docutils 0.5.
- Properly call super() in overridden blocks in templates.
- Add a fix when using XeTeX.
- · Unify handling of LaTeX escaping.
- Rebuild everything when the extensions config value changes.
- Don't try to remove a nonexisting static directory.
- Fix an indentation problem in production lists.
- Fix encoding handling for literal include files: literalinclude now has an encoding option that defaults to UTF-8.
- Fix the handling of non-ASCII characters entered in quickstart.
- Fix a crash with nonexisting image URIs.

14.168 Release 0.4.2 (Jul 29, 2008)

- Fix rendering of the samp role in HTML.
- Fix a bug with LaTeX links to headings leading to a wrong page.
- Reread documents with globbed toctrees when source files are added or removed.
- Add a missing parameter to PickleHTMLBuilder.handle_page().
- Put inheritance info always on its own line.
- Don't automatically enclose code with whitespace in it in quotes; only do this for the samp role.
- autodoc now emits a more precise error message when a module can't be imported or an attribute can't be found.
- The JavaScript search now uses the correct file name suffix when referring to found items.
- The automodule directive now accepts the inherited-members and show-inheritance options again.
- You can now rebuild the docs normally after relocating the source and/or doctree directory.

14.169 Release 0.4.1 (Jul 5, 2008)

- Added sub-/superscript node handling to TextBuilder.
- Label names in references are now case-insensitive, since reST label names are always lowercased.
- Fix linkcheck builder crash for malformed URLs.
- Add compatibility for admonitions and Docutils 0.5.
- Remove the silly restriction on "rubric" in the LaTeX writer: you can now write arbitrary "rubric" directives, and only those with a title of "Footnotes" will be ignored.
- Copy the HTML logo to the output _static directory.
- Fix LaTeX code for modules with underscores in names and platforms.
- Fix a crash with nonlocal image URIs.
- Allow the usage of :noindex: in automodule directives, as documented.
- Fix the delete() docstring processor function in autodoc.
- Fix warning message for nonexisting images.
- Fix JavaScript search in Internet Explorer.

14.170 Release 0.4 (Jun 23, 2008)

New features added

- tocdepth can be given as a file-wide metadata entry, and specifies the maximum depth of a TOC of this file.
- The new config value default_role can be used to select the default role for all documents.
- Sphinx now interprets field lists with fields like :param foo: in description units.
- The new staticmethod directive can be used to mark methods as static methods.
- HTML output:
 - The "previous" and "next" links have a more logical structure, so that by following "next" links you can traverse the entire TOC tree.
 - The new event html-page-context can be used to include custom values into the context used when rendering an HTML template.
 - Document metadata is now in the default template context, under the name metadata.
 - The new config value html_favicon can be used to set a favicon for the HTML output. Thanks to Sebastian Wiesner.
 - The new config value html_use_index can be used to switch index generation in HTML documents off.
 - The new config value html_split_index can be used to create separate index pages for each letter, to be used when the complete index is too large for one page.
 - The new config value html_short_title can be used to set a shorter title for the documentation which is then used in the navigation bar.
 - The new config value html_show_sphinx can be used to control whether a link to Sphinx is added to the HTML footer.

- The new config value html_file_suffix can be used to set the HTML file suffix to e.g. .xhtml.
- The directories in the html_static_path can now contain subdirectories.
- The module index now isn't collapsed if the number of submodules is larger than the number of toplevel modules.
- The image directive now supports specifying the extension as .*, which makes the builder select the one that matches best. Thanks to Sebastian Wiesner.
- The new config value exclude_trees can be used to exclude whole subtrees from the search for source files.
- Defaults for configuration values can now be callables, which allows dynamic defaults.
- The new TextBuilder creates plain-text output.
- Python 3-style signatures, giving a return annotation via ->, are now supported.
- Extensions:
 - The autodoc extension now offers a much more flexible way to manipulate docstrings before including them into the output, via the new autodoc-process-docstring event.
 - The autodoc extension accepts signatures for functions, methods and classes now that override the signature got via introspection from Python code.
 - The autodoc extension now offers a show-inheritance option for autoclass that inserts a list of bases after the signature.
 - The autodoc directives now support the noindex flag option.

Bugs fixed

- Correctly report the source location for docstrings included with autodoc.
- Fix the LaTeX output of description units with multiple signatures.
- Handle the figure directive in LaTeX output.
- Handle raw admonitions in LaTeX output.
- Fix determination of the title in HTML help output.
- Handle project names containing spaces.
- Don't write SSI-like comments in HTML output.
- Rename the "sidebar" class to "sphinxsidebar" in order to stay different from reST sidebars.
- Use a binary TOC in HTML help generation to fix issues links without explicit anchors.
- Fix behavior of references to functions/methods with an explicit title.
- Support citation, subscript and superscript nodes in LaTeX writer.
- Provide the standard "class" directive as "cssclass"; else it is shadowed by the Sphinx-defined directive.
- Fix the handling of explicit module names given to autoclass directives. They now show up with the correct module name in the generated docs.
- Enable autodoc to process Unicode docstrings.
- The LaTeX writer now translates line blocks with \raggedright, which plays nicer with tables.
- Fix bug with directories in the HTML builder static path.

14.171 Release 0.3 (May 6, 2008)

New features added

- The toctree directive now supports a glob option that allows glob-style entries in the content.
- If the pygments_style config value contains a dot it's treated as the import path of a custom Pygments style class.
- A new config value, exclude_dirs, can be used to exclude whole directories from the search for source files.
- The configuration directory (containing conf.py) can now be set independently from the source directory. For that, a new command-line option -c has been added.
- A new directive tabularcolumns can be used to give a tabular column specification for LaTeX output. Tables now use the tabulary package. Literal blocks can now be placed in tables, with several caveats.
- A new config value, latex_use_parts, can be used to enable parts in LaTeX documents.
- · Autodoc now skips inherited members for classes, unless you give the new inherited-members option.
- A new config value, autoclass_content, selects if the docstring of the class' __init__ method is added to the directive's body.
- Support for C++ class names (in the style Class::Function) in C function descriptions.
- Support for a toctree_only item in items for the latex_documents config value. This only includes the documents referenced by TOC trees in the output, not the rest of the file containing the directive.

Bugs fixed

- sphinx.htmlwriter: Correctly write the TOC file for any structure of the master document. Also encode non-ASCII characters as entities in TOC and index file. Remove two remaining instances of hard-coded "documentation".
- sphinx.ext.autodoc: descriptors are detected properly now.
- sphinx.latexwriter: implement all reST admonitions, not just note and warning.
- Lots of little fixes to the LaTeX output and style.
- Fix OpenSearch template and make template URL absolute. The html_use_opensearch config value now must give the base URL.
- Some unused files are now stripped from the HTML help file build.

14.172 Release 0.2 (Apr 27, 2008)

Incompatible changes

• Jinja, the template engine used for the default HTML templates, is now no longer shipped with Sphinx. If it is not installed automatically for you (it is now listed as a dependency in setup.py), install it manually from PyPI. This will also be needed if you're using Sphinx from a SVN checkout; in that case please also remove the sphinx/jinja directory that may be left over from old revisions.

• The clumsy handling of the index.html template was removed. The config value html_index is gone, and html_additional_pages should be used instead. If you need it, the old index.html template is still there, called defindex.html, and you can port your html_index template, using Jinja inheritance, by changing your template:

```
{% extends "defindex.html" %}
{% block tables %}
... old html_index template content ...
{% endblock %}
```

and putting 'index': name of your template in html_additional_pages.

• In the layout template, redundant blocks were removed; you should use Jinja's standard {{ super() }} mechanism instead, as explained in the (newly written) templating docs.

New features added

- Extension API (Application object):
 - Support a new method, add_crossref_type. It works like add_description_unit but the directive will only create a target and no output.
 - Support a new method, add_transform. It takes a standard Docutils Transform subclass which is then
 applied by Sphinx's reader on parsing reST document trees.
 - Add support for other template engines than Jinja, by adding an abstraction called a "template bridge".
 This class handles rendering of templates and can be changed using the new configuration value "template_bridge".
 - The config file itself can be an extension (if it provides a setup() function).
- Markup:
 - New directive, currentmodule. It can be used to indicate the module name of the following documented things without creating index entries.
 - Allow giving a different title to documents in the toctree.
 - Allow giving multiple options in a cmdoption directive.
 - Fix display of class members without explicit class name given.
- Templates (HTML output):
 - index.html renamed to defindex.html, see above.
 - There's a new config value, html_title, that controls the overall "title" of the set of Sphinx docs. It is used instead everywhere instead of "Projectname vX.Y documentation" now.
 - All references to "documentation" in the templates have been removed, so that it is now easier to use Sphinx for non-documentation documents with the default templates.
 - Templates now have an XHTML doctype, to be consistent with Docutils' HTML output.
 - You can now create an OpenSearch description file with the html_use_opensearch config value.
 - You can now quickly include a logo in the sidebar, using the html_logo config value.
 - There are new blocks in the sidebar, so that you can easily insert content into the sidebar.
- LaTeX output:
 - The sphinx.sty package was cleaned of unused stuff.

- You can include a logo in the title page with the latex_logo config value.
- You can define the link colors and a border and background color for verbatim environments.

Thanks to Jacob Kaplan-Moss, Talin, Jeroen Ruigrok van der Werven and Sebastian Wiesner for suggestions.

Bugs fixed

- sphinx.ext.autodoc: Don't check __module__ for explicitly given members. Remove "self" in class constructor argument list.
- sphinx.htmlwriter: Don't use os.path for joining image HREFs.
- sphinx.htmlwriter: Don't use SmartyPants for HTML attribute values.
- sphinx.latexwriter: Implement option lists. Also, some other changes were made to sphinx.sty in order to enhance compatibility and remove old unused stuff. Thanks to Gael Varoquaux for that!
- sphinx.roles: Fix referencing glossary terms with explicit targets.
- sphinx.environment: Don't swallow TOC entries when resolving subtrees.
- sphinx.quickstart: Create a sensible default latex_documents setting.
- sphinx.builder, sphinx.environment: Gracefully handle some user error cases.
- sphinx.util: Follow symbolic links when searching for documents.

14.173 Release 0.1.61950 (Mar 26, 2008)

• sphinx.quickstart: Fix format string for Makefile.

14.174 Release 0.1.61945 (Mar 26, 2008)

- sphinx.htmlwriter, sphinx.latexwriter: Support the .. image:: directive by copying image files to the output directory.
- sphinx.builder: Consistently name "special" HTML output directories with a leading underscore; this means _sources and _static.
- sphinx.environment: Take dependent files into account when collecting the set of outdated sources.
- sphinx.directives: Record files included with .. literalinclude:: as dependencies.
- sphinx.ext.autodoc: Record files from which docstrings are included as dependencies.
- sphinx.builder: Rebuild all HTML files in case of a template change.
- sphinx.builder: Handle unavailability of TOC relations (previous/ next chapter) more gracefully in the HTML builder.
- sphinx.latexwriter: Include fncychap.sty which doesn't seem to be very common in TeX distributions. Add a clean target in the latex Makefile. Really pass the correct paper and size options to the LaTeX document class.
- setup: On Python 2.4, don't egg-depend on Docutils if a Docutils is already installed else it will be overwritten.

14.175 Release 0.1.61843 (Mar 24, 2008)

- sphinx.quickstart: Really don't create a makefile if the user doesn't want one.
- setup: Don't install scripts twice, via setuptools entry points and distutils scripts. Only install via entry points.
- sphinx.builder: Don't recognize the HTML builder's copied source files (under _sources) as input files if the source suffix is .txt.
- sphinx.highlighting: Generate correct markup for LaTeX Verbatim environment escapes even if Pygments is not installed.
- sphinx.builder: The WebHTMLBuilder is now called PickleHTMLBuilder.
- sphinx.htmlwriter: Make parsed-literal blocks work as expected, not highlighting them via Pygments.
- sphinx.environment: Don't error out on reading an empty source file.

14.176 Release 0.1.61798 (Mar 23, 2008)

- sphinx: Work with Docutils SVN snapshots as well as 0.4.
- sphinx.ext.doctest: Make the group in which doctest blocks are placed selectable, and default to 'default'.
- sphinx.ext.doctest: Replace <BLANKLINE> in doctest blocks by real blank lines for presentation output, and remove doctest options given inline.
- sphinx.environment: Move doctest_blocks out of block_quotes to support indented doctest blocks.
- sphinx.ext.autodoc: Render .. automodule:: docstrings in a section node, so that module docstrings can contain proper sectioning.
- sphinx.ext.autodoc: Use the module's encoding for decoding docstrings, rather than requiring ASCII.

14.177 Release 0.1.61611 (Mar 21, 2008)

· First public release.

PROJECTS USING SPHINX

This is an (incomplete) alphabetic list of projects that use Sphinx or are experimenting with using it for their documentation. If you like to be included, please mail to the Google group⁴⁰⁵⁶.

I've grouped the list into sections to make it easier to find interesting examples.

15.1 Documentation using the alabaster theme

- Alabaster⁴⁰⁵⁷
- Blinker⁴⁰⁵⁸
- Calibre⁴⁰⁵⁹
- CherryPy⁴⁰⁶⁰
- Click⁴⁰⁶¹ (customized)
- coala⁴⁰⁶² (customized)
- CodePy⁴⁰⁶³
- Django Q⁴⁰⁶⁴
- Eve⁴⁰⁶⁵ (Python REST API framework)
- Fabric⁴⁰⁶⁶
- Fityk⁴⁰⁶⁷
- Flask⁴⁰⁶⁸
- Flask-OpenID⁴⁰⁶⁹

15.12 Theses produced using Sphinx

- "Content Conditioning and Distribution for Dynamic Virtual Worlds" 4460
- "The Sphinx Thesis Resource" 4461

15.13 Projects integrating Sphinx functionality

- Read the Docs⁴⁴⁶², a software-as-a-service documentation hosting platform, uses Sphinx to automatically build documentation updates that are pushed to GitHub.
- Spyder⁴⁴⁶³, the Scientific Python Development Environment, uses Sphinx in its help pane to render rich documentation for functions, classes and methods automatically or on-demand.
